Note: values in blue are calculated

When reported as below DL half DL was used

highlighted cells are material analyzed in 2011 and might have had too much time to oxidize in storage

QUANTITATIVE PHASE ANALYSIS OF 26 POWDER SAMPLES USING THE RIETVELD METHOD AND X-RAY POWDER DIFFRACTION DATA.

(Project: 1005 Seabridge KSM – PO# 42083)

March 24, 2010

EXPERIMENTAL METHOD

The twenty-six samples of **Project 1005 Seabridge KSM** were reduced to the optimum grain-size range for quantitative X-ray analysis (<10 μm) by grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Step-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

RESULTS

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 and Search-Match software by Siemens (Bruker). X-ray powder-diffraction data of the samples were refined with Rietveld program Topas 4.2 (Bruker AXS). The results of quantitative phase analysis by Rietveld refinements are given in Table 1 (separate file, ***SGS CEMI Results Mar 24 2010 - Proj 1005 Seabridge KSM.xls***). These amounts represent the relative amounts of crystalline phases normalized to 100%. Ideal formulae for the minerals are given in Table 2. The Rietveld refinement plots are shown in Figures 1 – 26.

Table 2.

Mineral	**Ideal formula**
Anhydrite	$CaSO_4$
Biotite	$K(Mg,Fe^{2+})_3AlSi_3O_{10}(OH)_2$
Brucite	$Mg(OH)_2$
Calcite	$CaCO_3$
Chalcopyrite	$CuFeS_2$
Clinochlore	$(Mg,Fe^{2+})_5Al(Si_3Al)O_{10}(OH)_8$
Diaspore	$AlO(OH)$
Dolomite	$CaMg(CO_3)_2$
Galena	PbS
Gypsum	$CaSO_4 \cdot 2H_2O$
Hematite	α-Fe_2O_3
Hydroxylapatite	$Ca_5(PO_4)_3(OH)$
K-feldspar	$KAlSi_3O_8$
Magnetite	Fe_3O_4
Molybdenite	MoS_2
Muscovite	$KAl_2AlSi_3O_{10}(OH)_2$
Plagioclase	$NaAlSi_3O_8 – CaAl_2Si_2O_8$
Pyrite	FeS_2
Quartz	SiO_2
Siderite	$Fe^{2+}CO_3$
Sphalerite	$(Zn,Fe)S$
Tennantite	$(Cu,Ag,Fe,Zn)_{12}As_4S_{13}$

Figure 1. January 30, 2012

EXPERIMENTAL METHOD

The five samples of **Project Rescan – Seabridge Sulphurets** were reduced to the optimum grain-size range for quantitative X-ray analysis (<10 μm) by grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Continuous-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

RESULTS

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 and Search-Match software by Siemens (Bruker). X-ray powder-diffraction data of the samples were refined with Rietveld program Topas 4.2 (Bruker AXS). The results of quantitative phase analysis by Rietveld refinements are given in Table 1. These amounts represent the relative amounts of crystalline phases normalized to 100%. The Rietveld refinement plots are shown in Figures 1 – 5.

Table 1. Results of quantitative phase analysis (wt.%)

Mineral	**Ideal Formula**	**3: Comp #3**	**42: Comp #42**	**64: Comp #64**	**66: Comp #66**	**69: Comp #69**

EXPERIMENTAL METHOD

The twenty-five samples of **Project # 0868-017-016-01 KSM Waste Rock Mineralogy** were reduced to the optimum grain-size range for quantitative X-ray analysis (<10 μm) by grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Step-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

RESULTS

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 and Search-Match software by Siemens (Bruker). X-ray powder-diffraction data of the samples were refined with Rietveld program Topas 4.2 (Bruker AXS). The results of quantitative phase analysis by Rietveld refinement are given in Table 1 (separate file, ***Rescan Environmental Services Ltd Results Feb 17 2012 – Proj 0868-017-016-01 KSM Waste Rock Mineralogy.xls***). These amounts represent the relative amounts of crystalline phases normalized to 100%. The Rietveld refinement plots are shown in Figures 1 – 25. The ideal formulae of phases present are given in Table 2.

Table 2.

Mineral	**Ideal Formula**
Actinolite	$Ca_2(Mg,Fe^{2+})_5Si_8O_{22}(OH)_2$
Anhydrite	$CaSO_4$
Ankerite/Dolomite	$Ca(Fe^{2+},Mg,Mn)(CO_3)_2/CaMg(CO_3)_2$
Barite	$BaSO_4$
Biotite	$K(Mg,Fe^{2+})_3AlSi_3O_{10}(OH)_2$
Calcite	$CaCO_3$
Chalcopyrite	$CuFeS_2$
Clinochlore	$(Mg,Fe^{2+})_5Al(Si_3Al)O_{10}(OH)_8$
Gypsum	$CaSO_4 \cdot 2H_2O$
Hematite	α-Fe_2O_3
K-feldspar	$KAlSi_3O_8$
Magnetite	Fe_3O_4
Muscovite 1M, 2M	$KAl_2(AlSi_3O_{10})(OH)_2$
Plagioclase	$NaAlSi_3O_8 - CaAl_2Si_2O_8$
Pyrite	FeS_2
Quartz	SiO_2
Siderite	$Fe^{2+}CO_3$
Titanite	$CaTiSiO_5$

EXPERIMENTAL METHOD

The eleven samples of **Project Rescan – Seabridge - Iron Cap** were reduced to the optimum grain-size range for quantitative X-ray analysis (<10 μm) by grinding under ethanol in a vibratory McCrone Micronising Mill for 7 minutes. Continuous-scan X-ray powder-diffraction data were collected over a range 3-80°2θ with CoKa radiation on a Bruker D8 Focus Bragg-Brentano diffractometer equipped with an Fe monochromator foil, 0.6 mm (0.3°) divergence slit, incident- and diffracted-beam Soller slits and a LynxEye detector. The long fine-focus Co X-ray tube was operated at 35 kV and 40 mA, using a take-off angle of 6°.

RESULTS

The X-ray diffractograms were analyzed using the International Centre for Diffraction Database PDF-4 and Search-Match software by Siemens (Bruker). X-ray powder-diffraction data of the samples were refined with Rietveld program Topas 4.2 (Bruker AXS). The results of quantitative phase analysis by Rietveld refinement are given in Table 1 (separate file, ***Maxxam Analytics Results Feb 15 2012 – Project Rescan-Seabridge – Iron Cap.xls***). These amounts represent the relative amounts of crystalline phases normalized to 100%. The Rietveld refinement plots are shown in Figures 1 – 11. Ideal formulae of the mineral phases are shown in Table 2.

Table 2.

Mineral	**Ideal Formula**
Ankerite – Dolomite	$Ca(Fe^{2+},Mg,Mn)(CO_3)_2 – CaMg(CO_3)_2$
Biotite	$K(Mg,Fe)_3(AlSi_3O_{10})(OH)_2$
Calcite	$CaCO_3$
Clinochlore	$(Mg,Fe^{2+})_5Al(Si_3Al)O_{10}(OH)_8$
Fluorite	CaF_2
K-Feldspar	$KAlSi_3O_8$
Molybdenite	MoS_2
Muscovite	$KAl_2(AlSi_3O_{10})(OH)_2$
Plagioclase	$NaAlSi_3O_8 – CaAl_2Si_2O_8$
Pyrite	FeS_2
Quartz	SiO_2
Siderite	$Fe^{2+}CO_3$
Sphalerite	(Zn,Fe)S

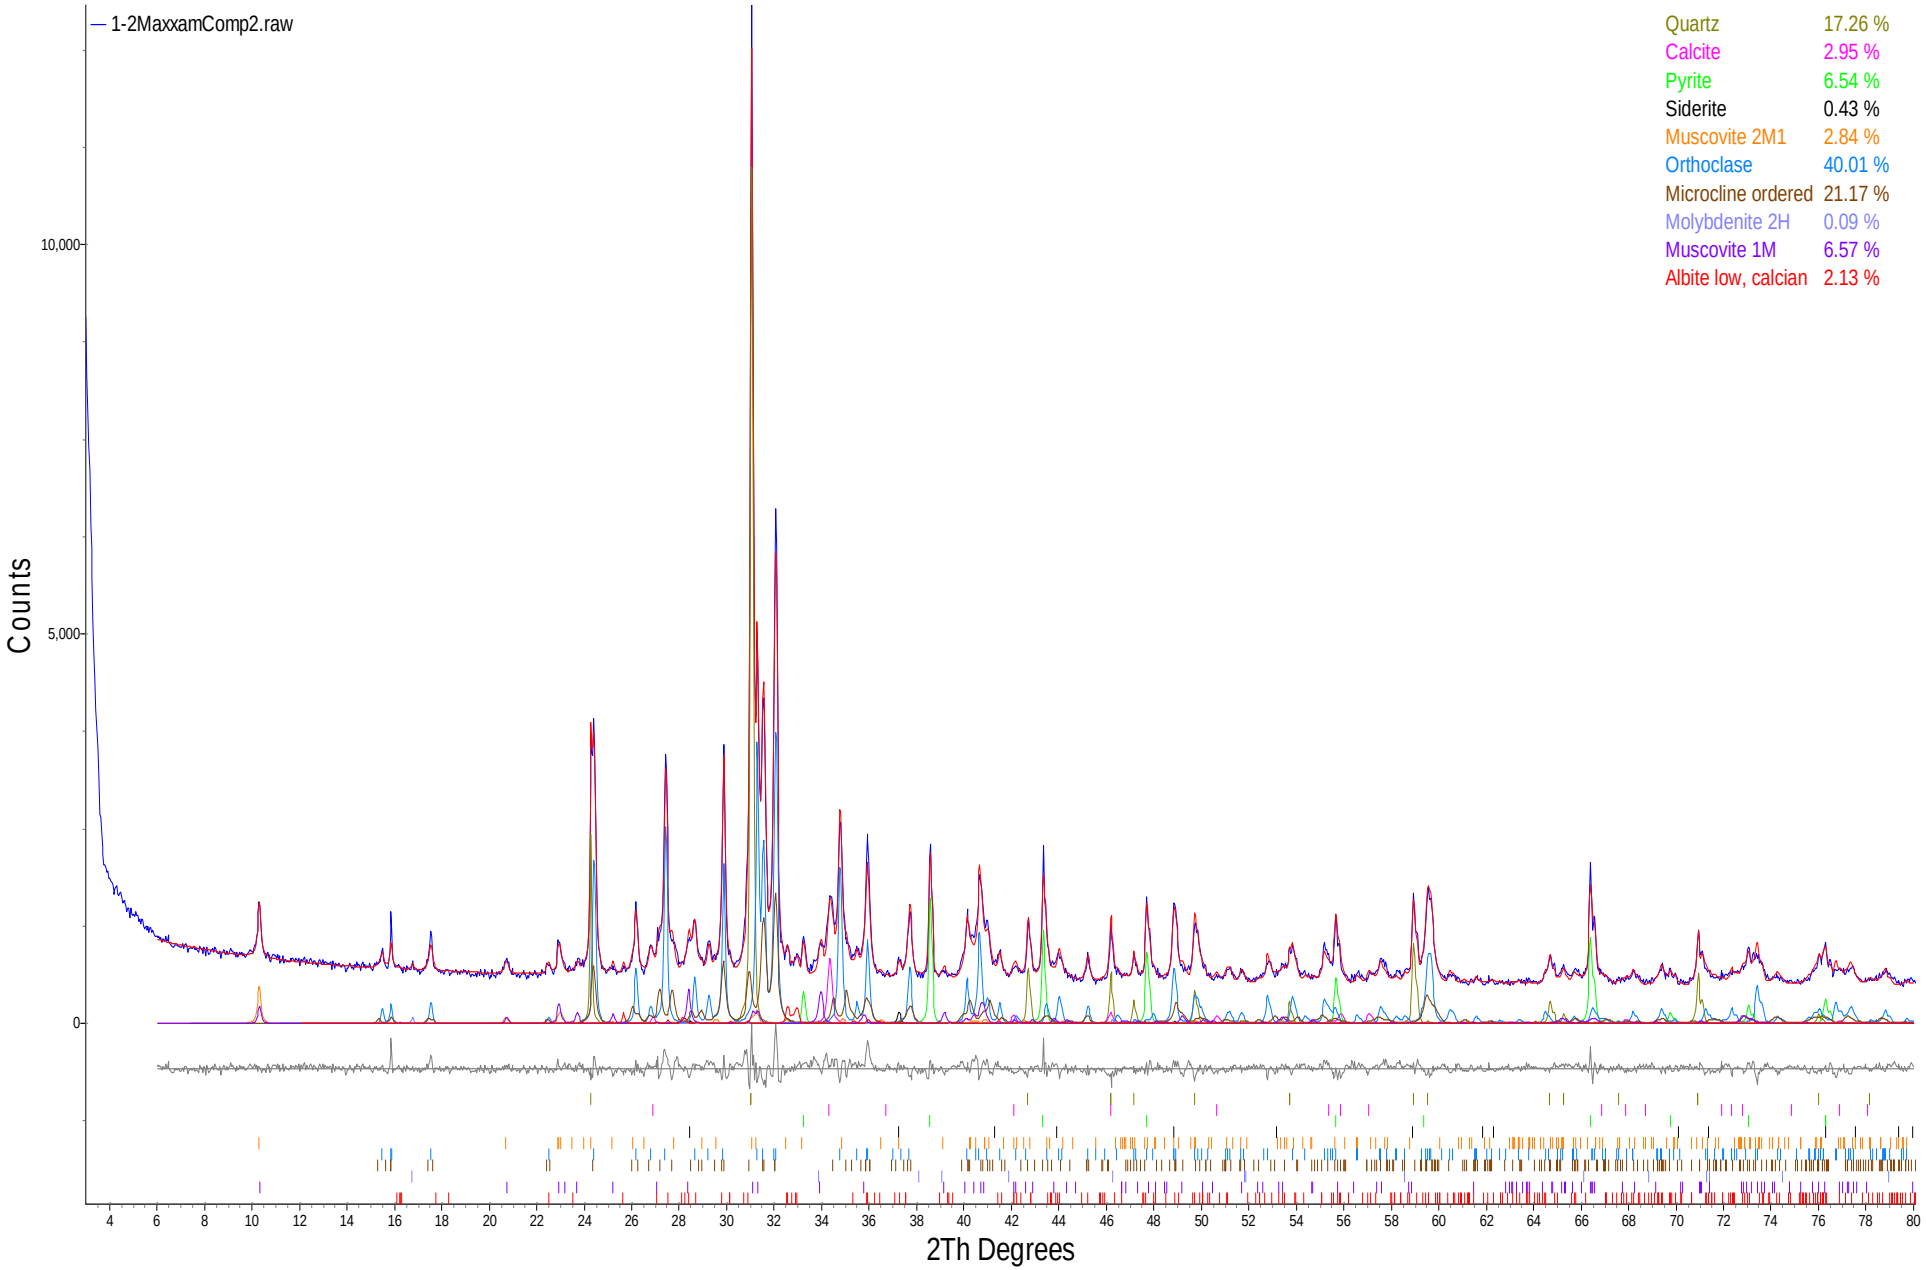

Figure 1. Rietveld refinement plot of sample **"Comp #2"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

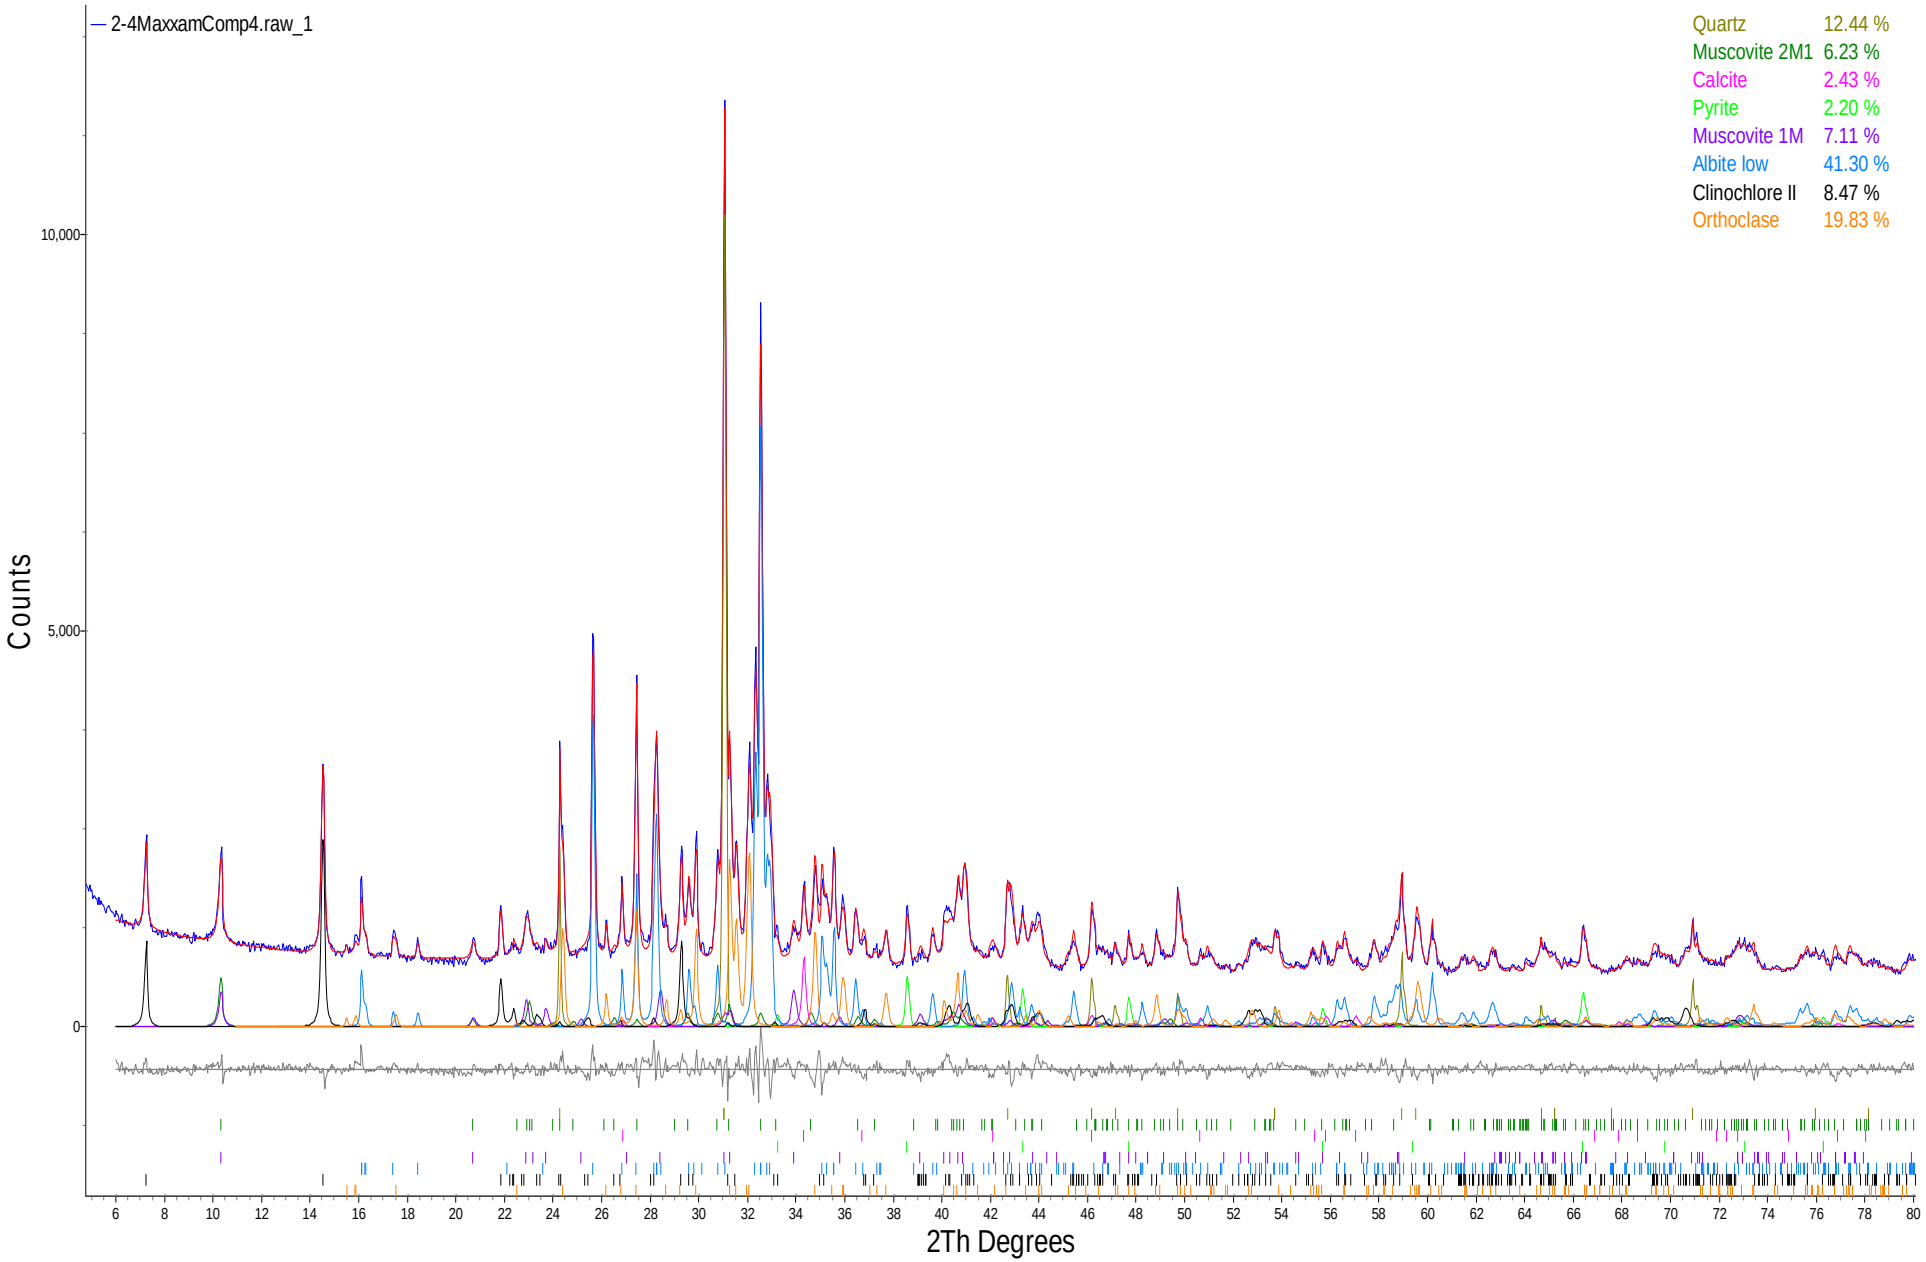

Figure 2. Rietveld refinement plot of sample **"Comp #4"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

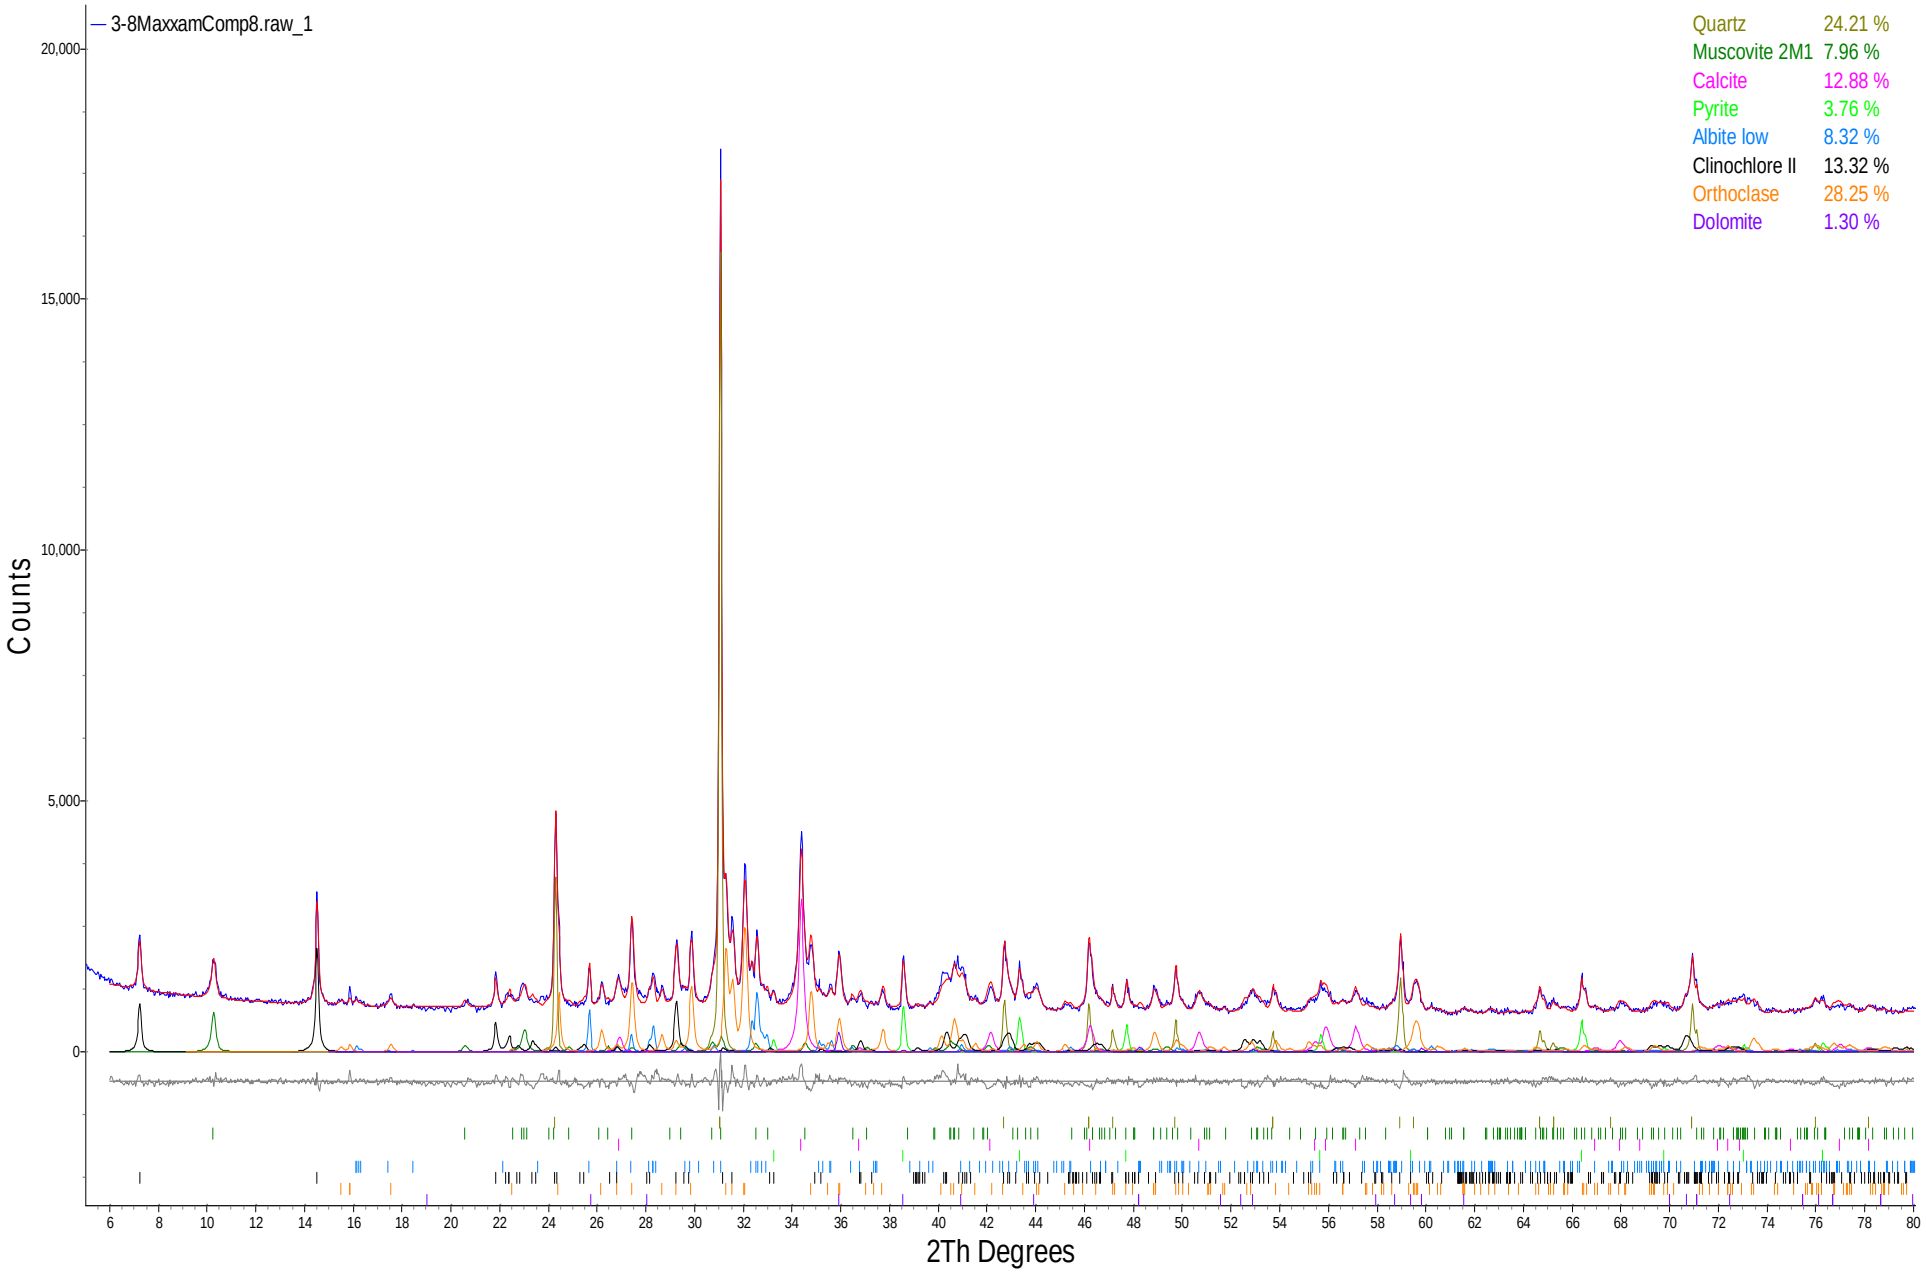

Figure 3. Rietveld refinement plot of sample **"Comp #8"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

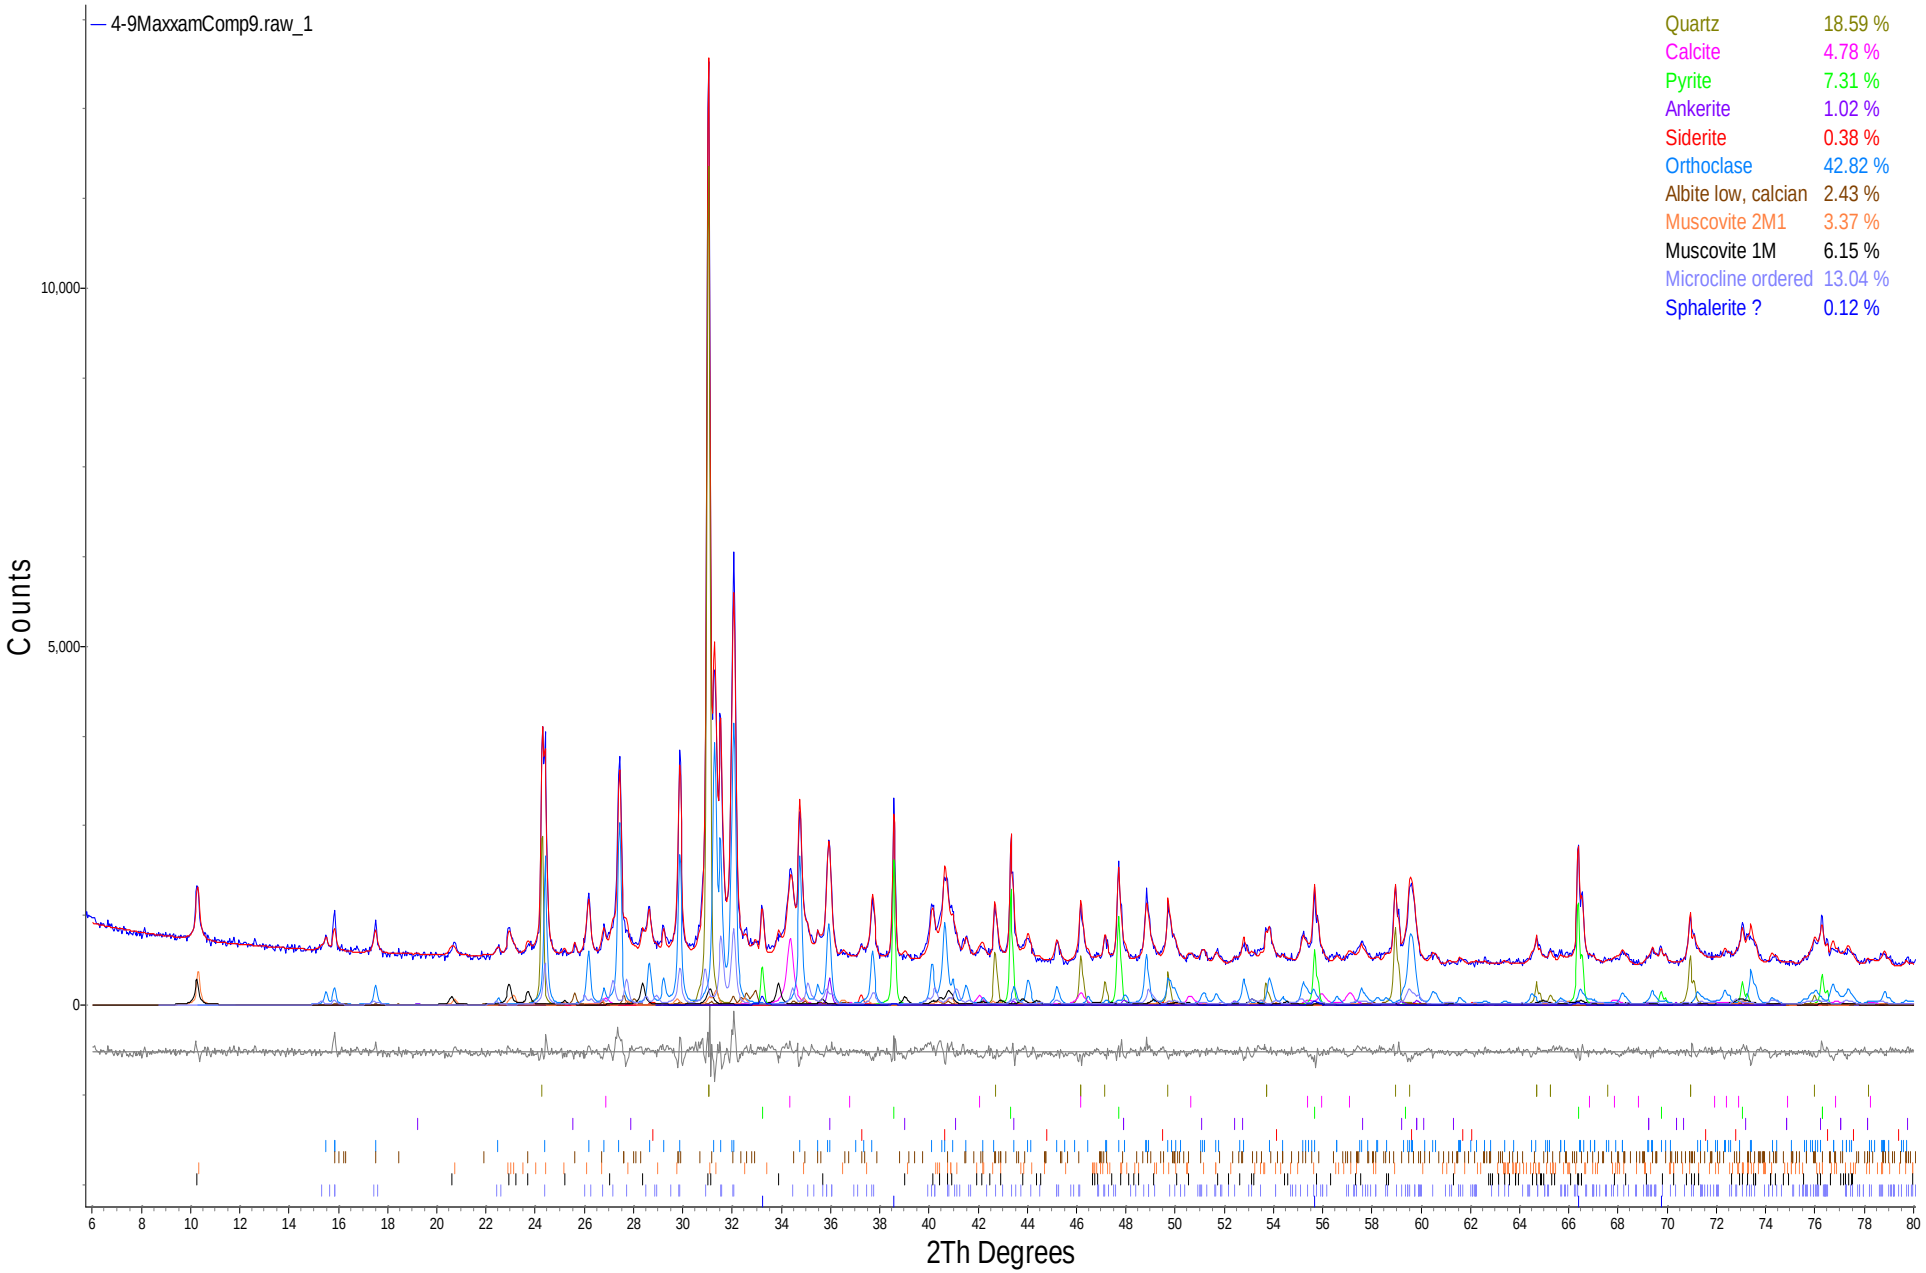

Figure 4. Rietveld refinement plot of sample **"Comp #9"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

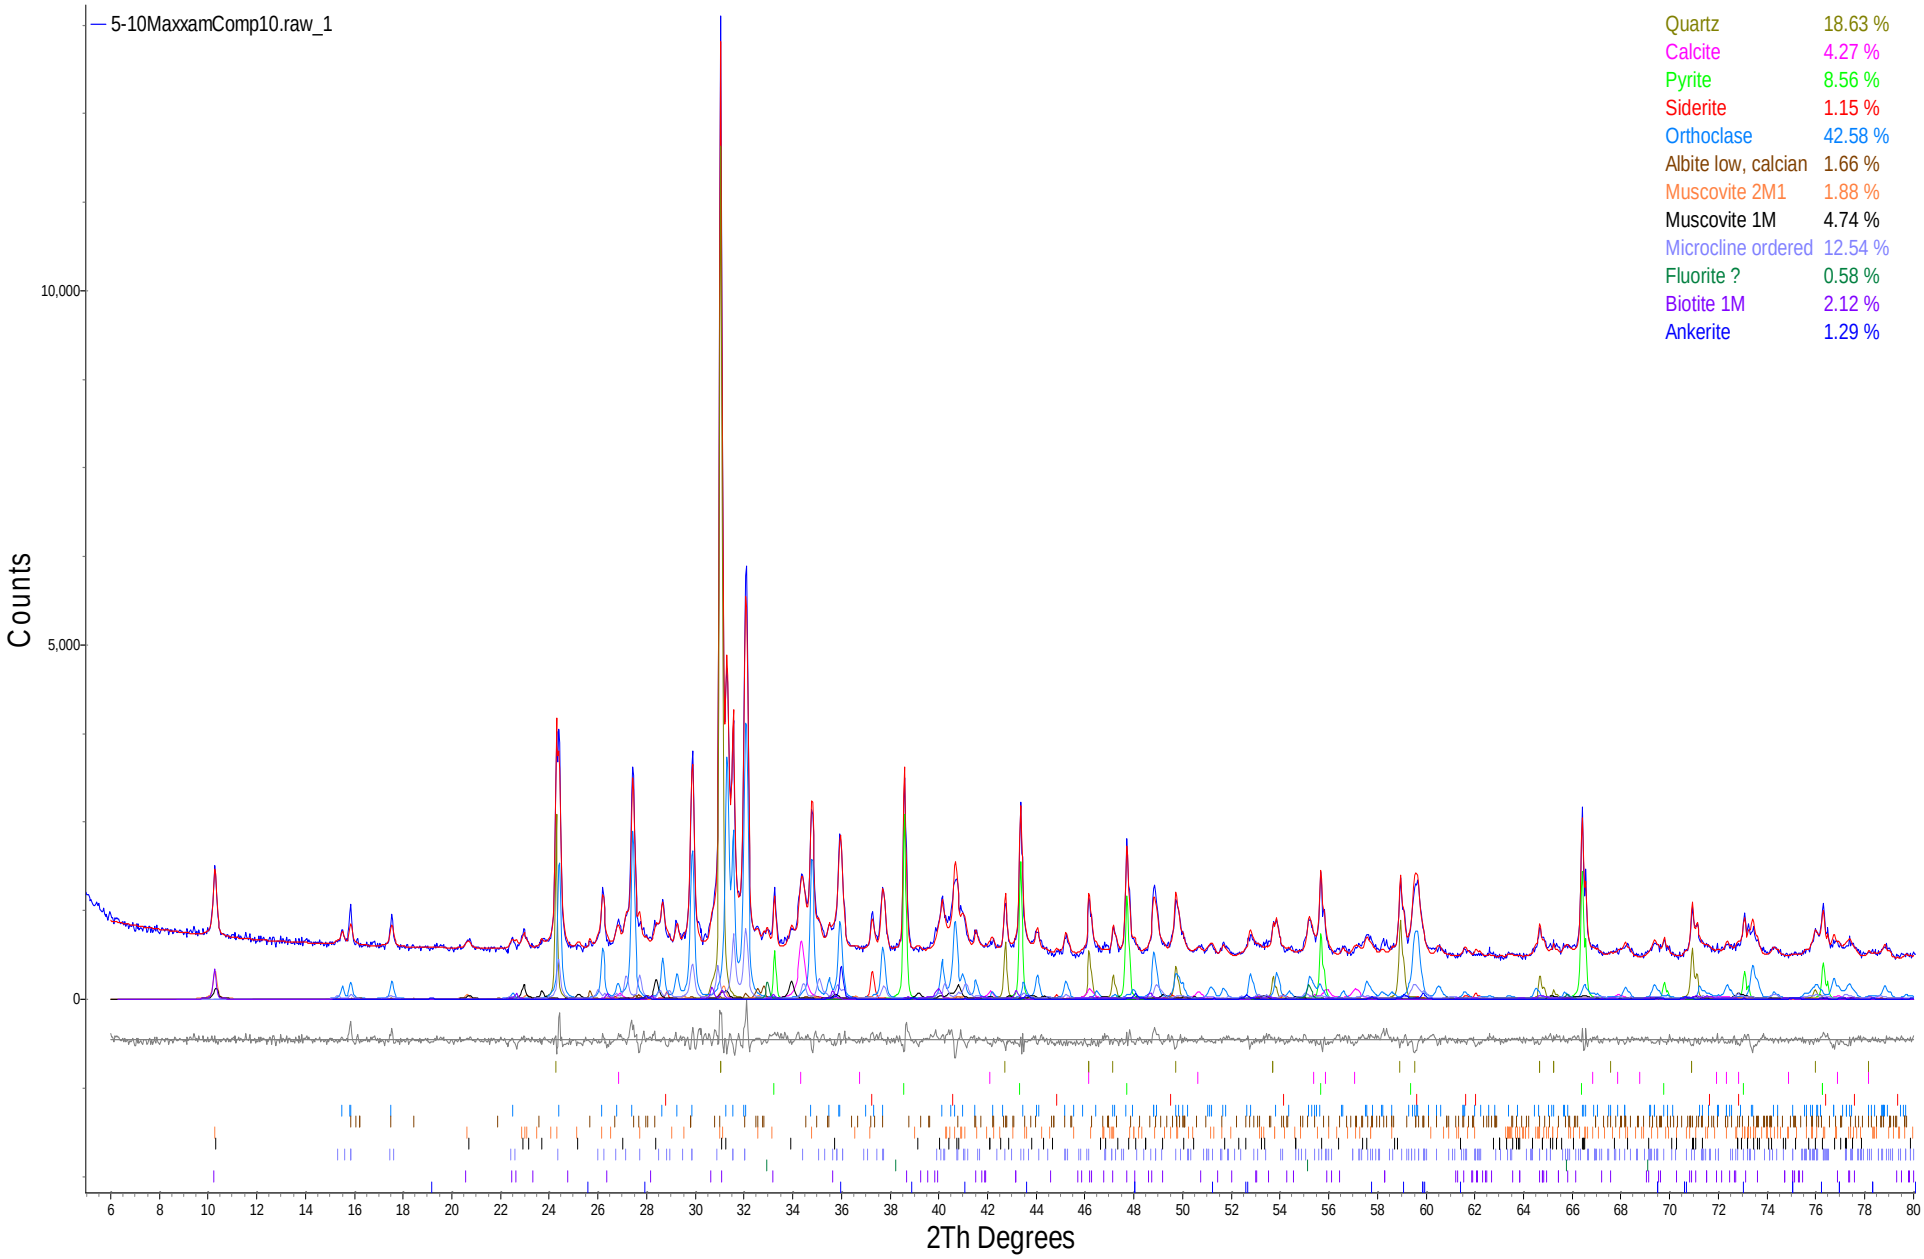

Figure 5. Rietveld refinement plot of sample **"Comp #10"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

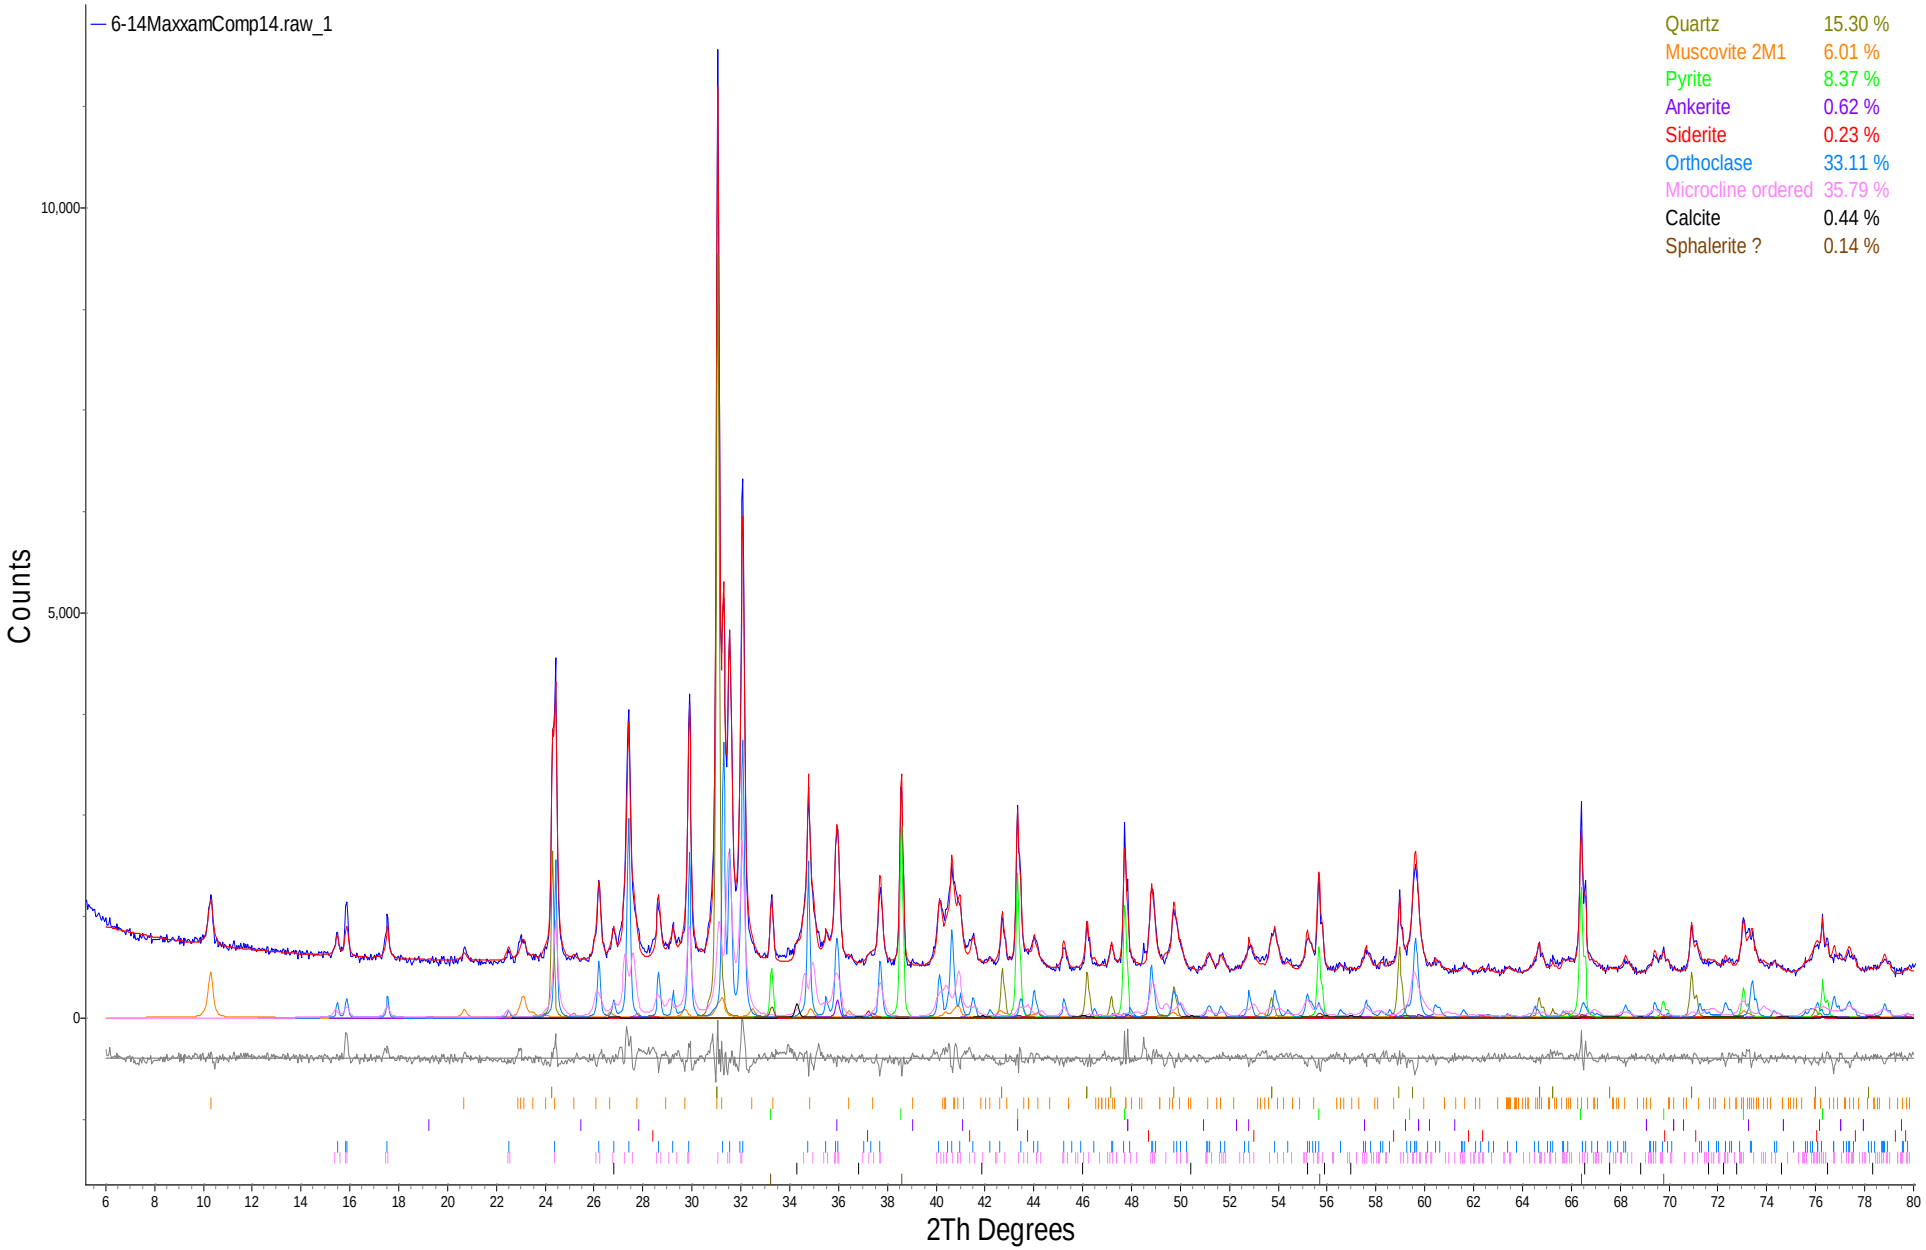

Figure 6. Rietveld refinement plot of sample **"Comp #14"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

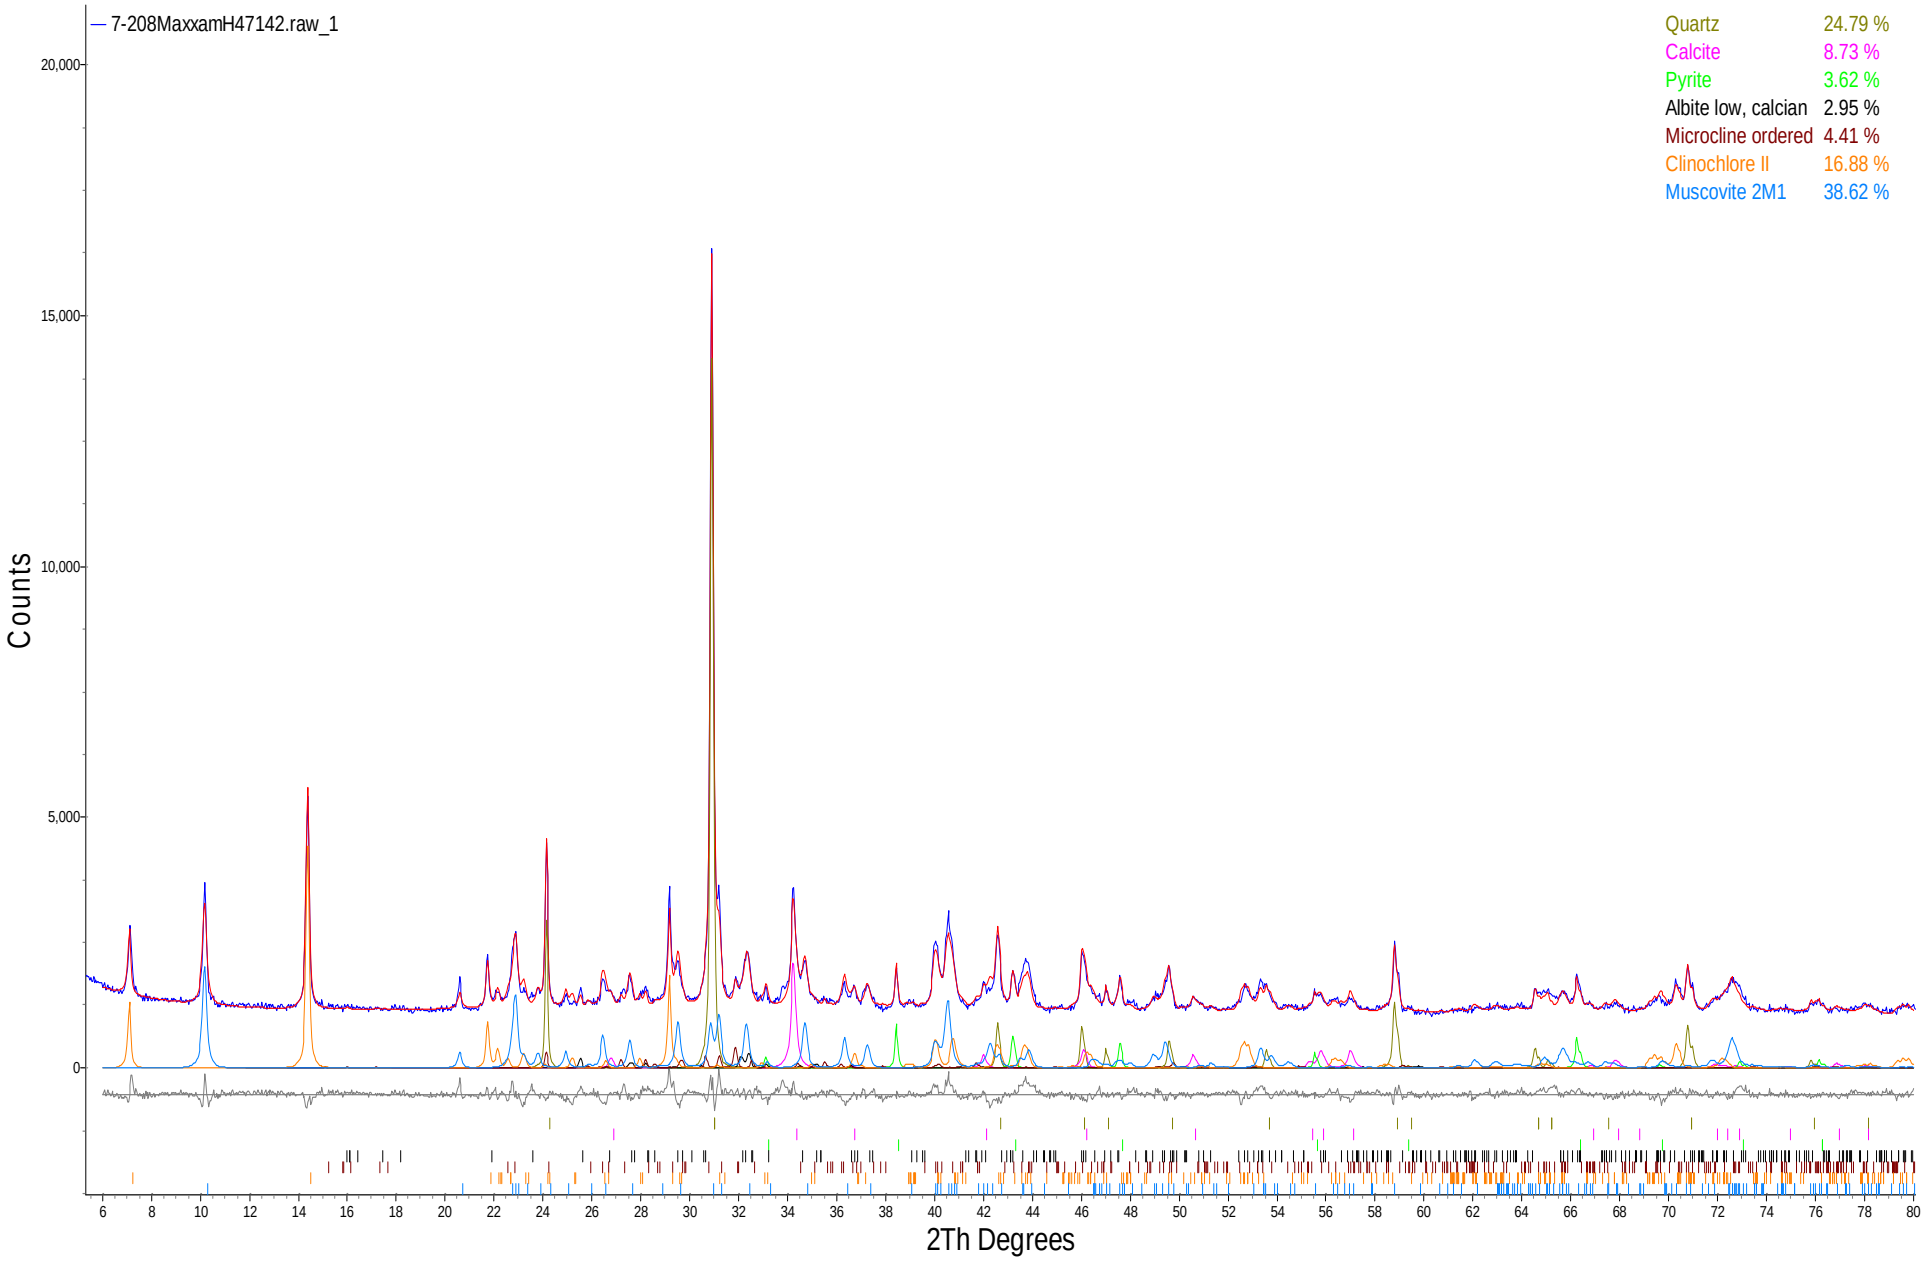

Figure 7. Rietveld refinement plot of sample **"H47142"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

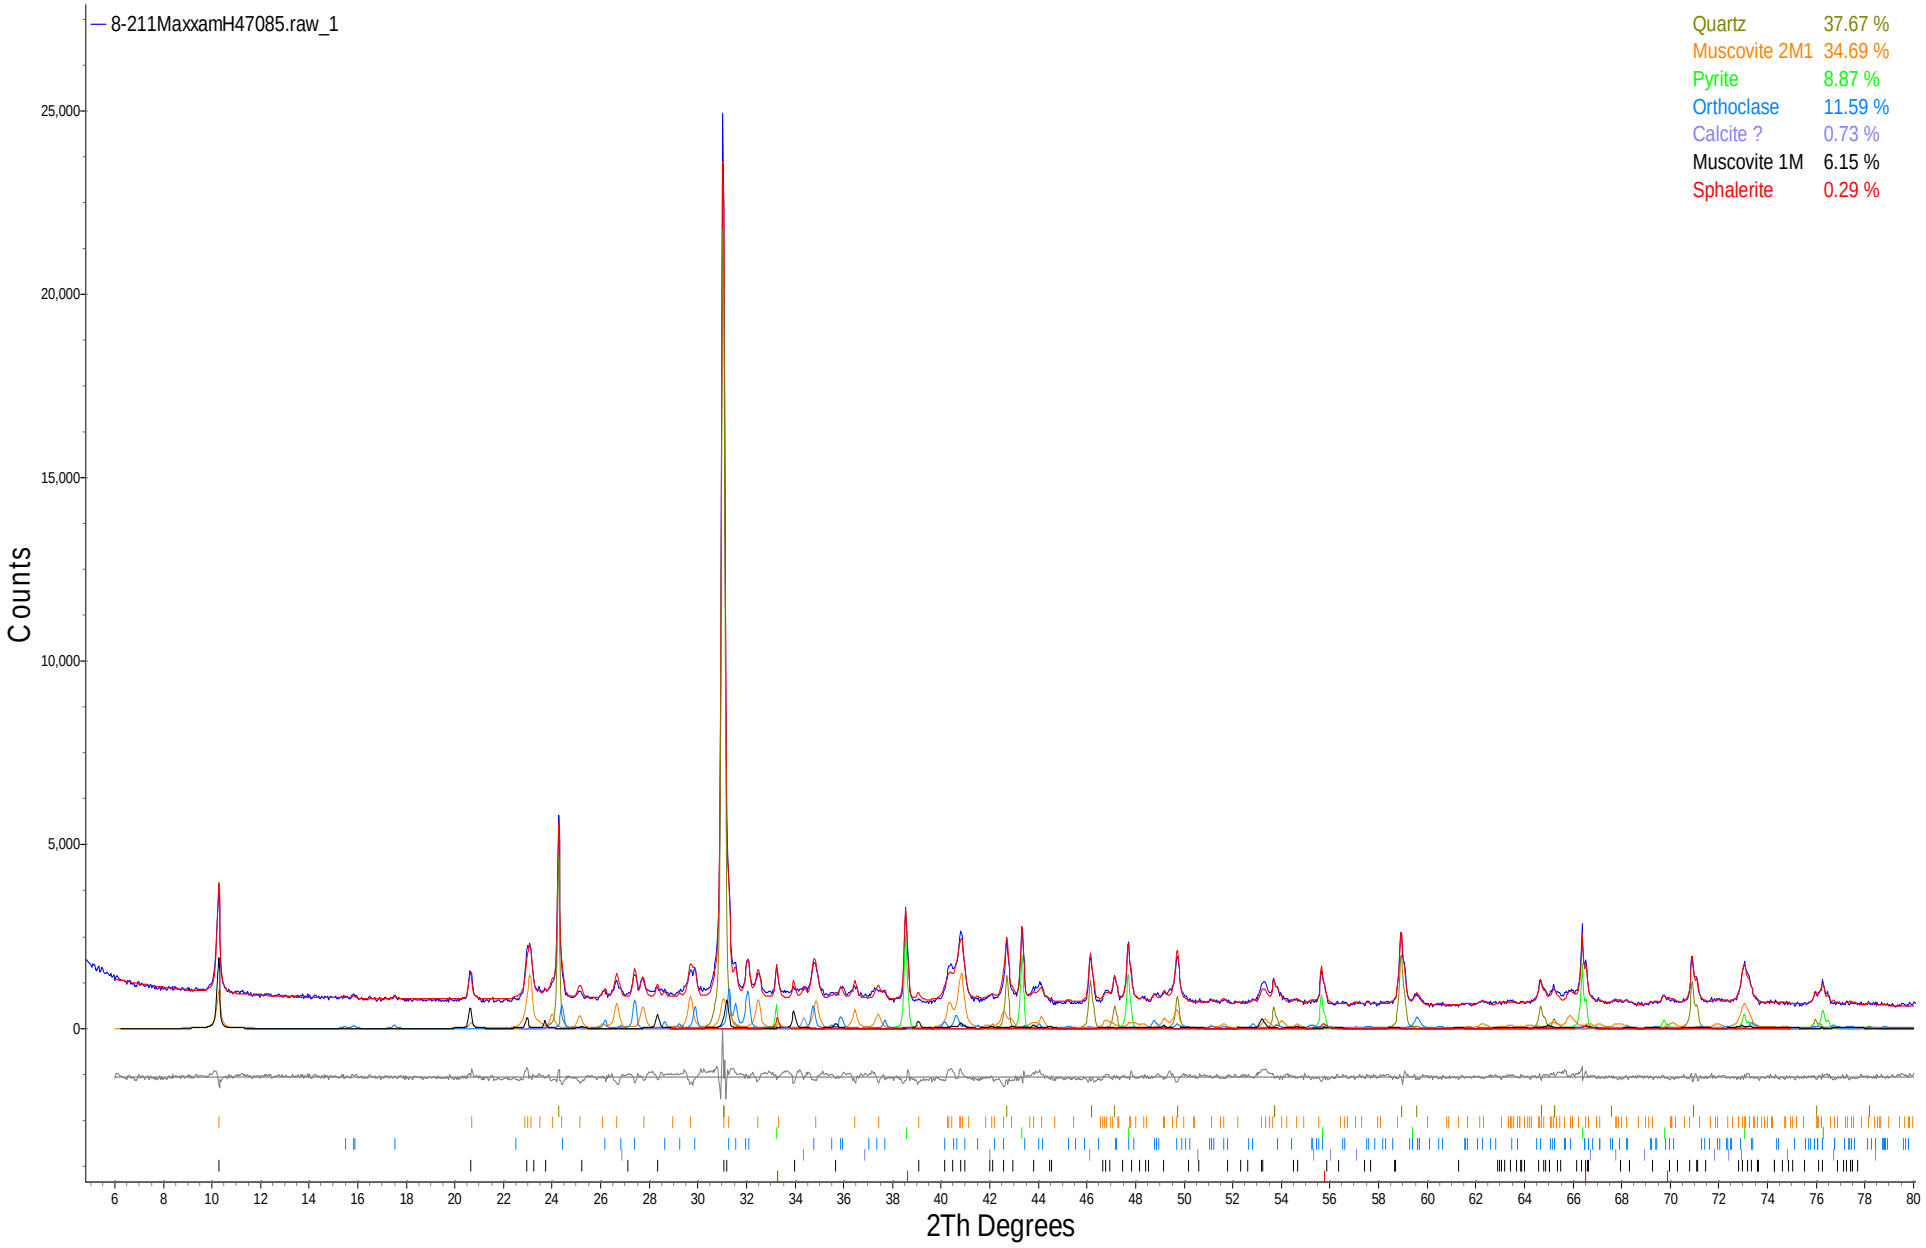

Figure 8. Rietveld refinement plot of sample **"H47085"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

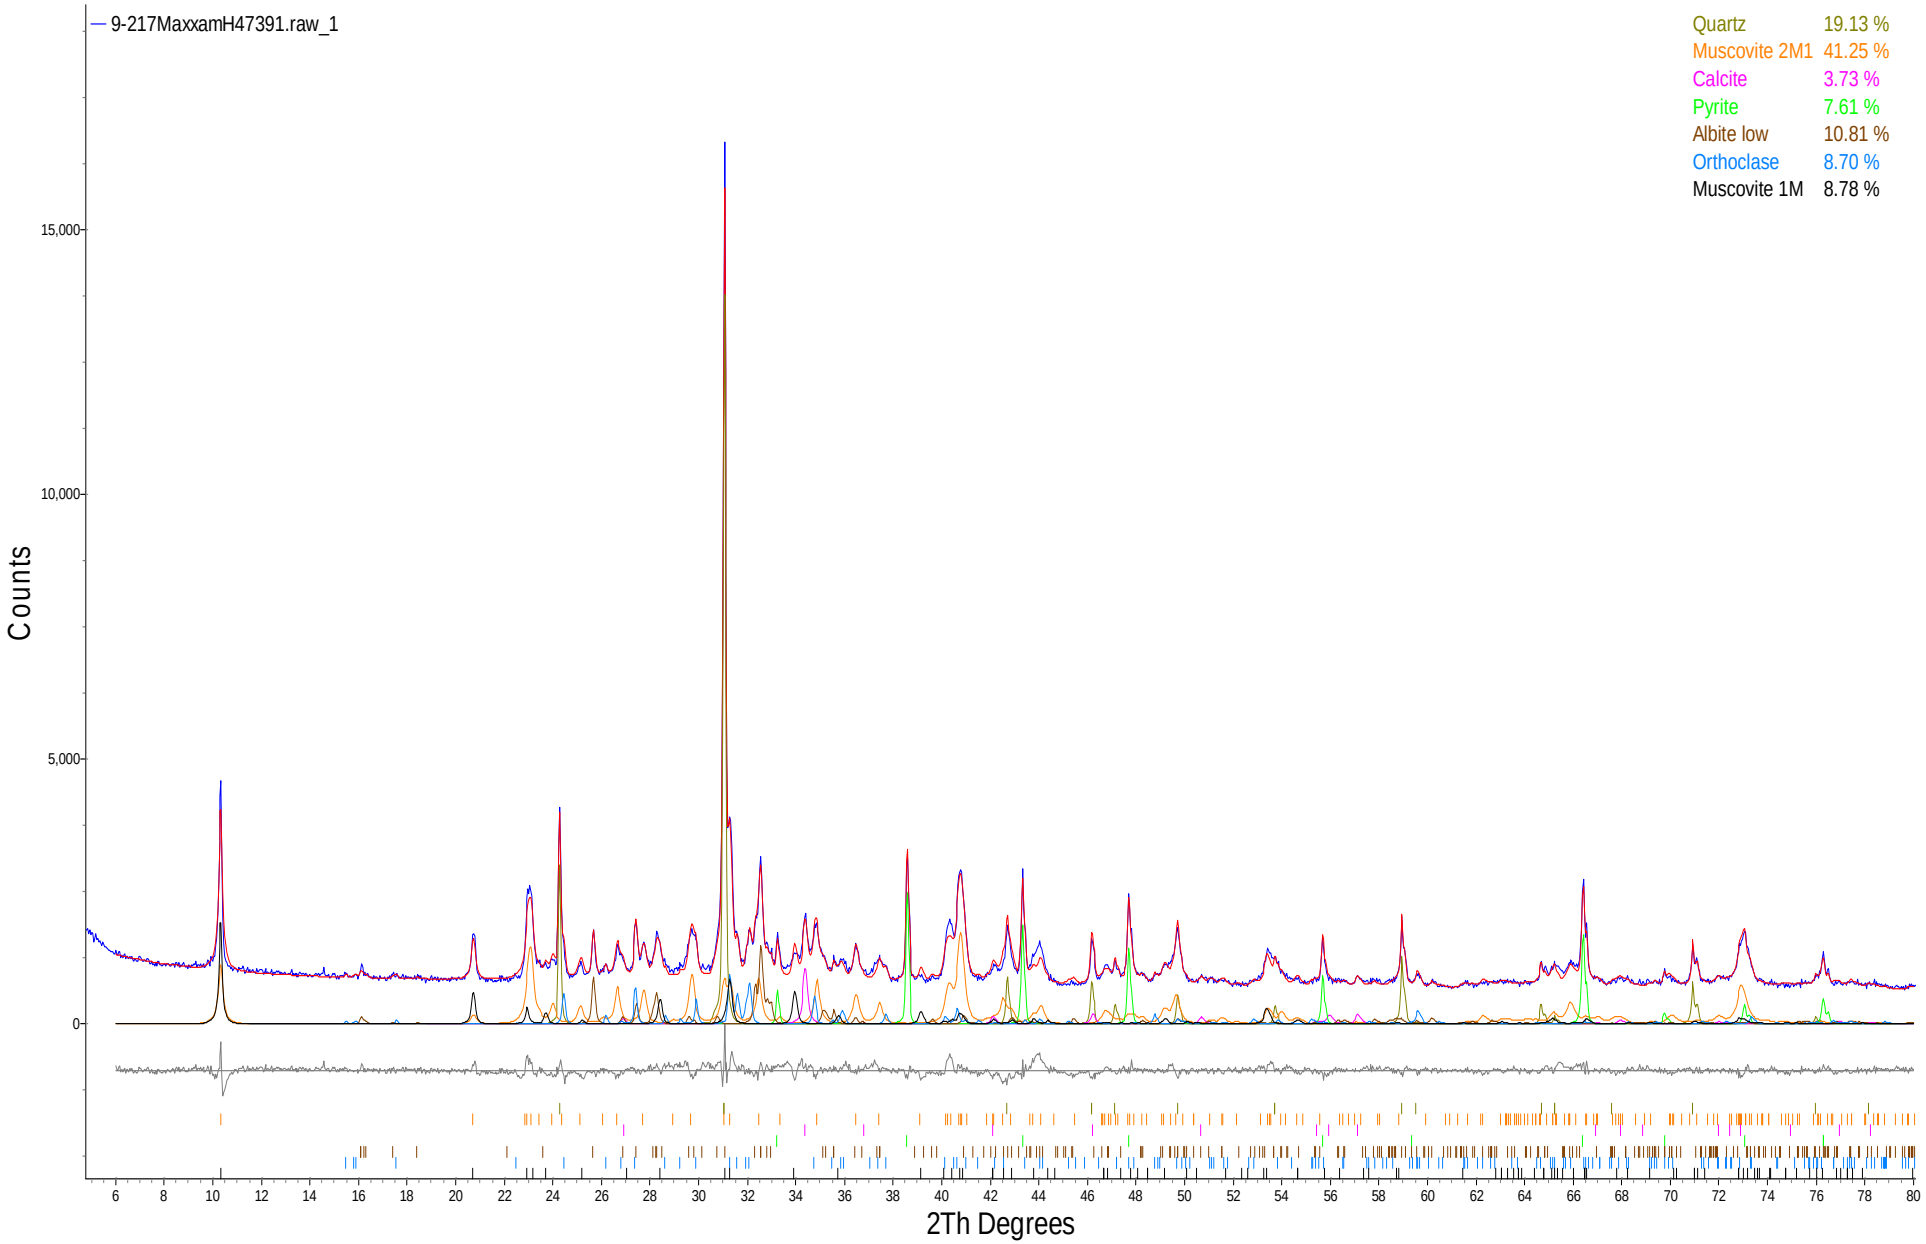

Figure 9. Rietveld refinement plot of sample **"H47391"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

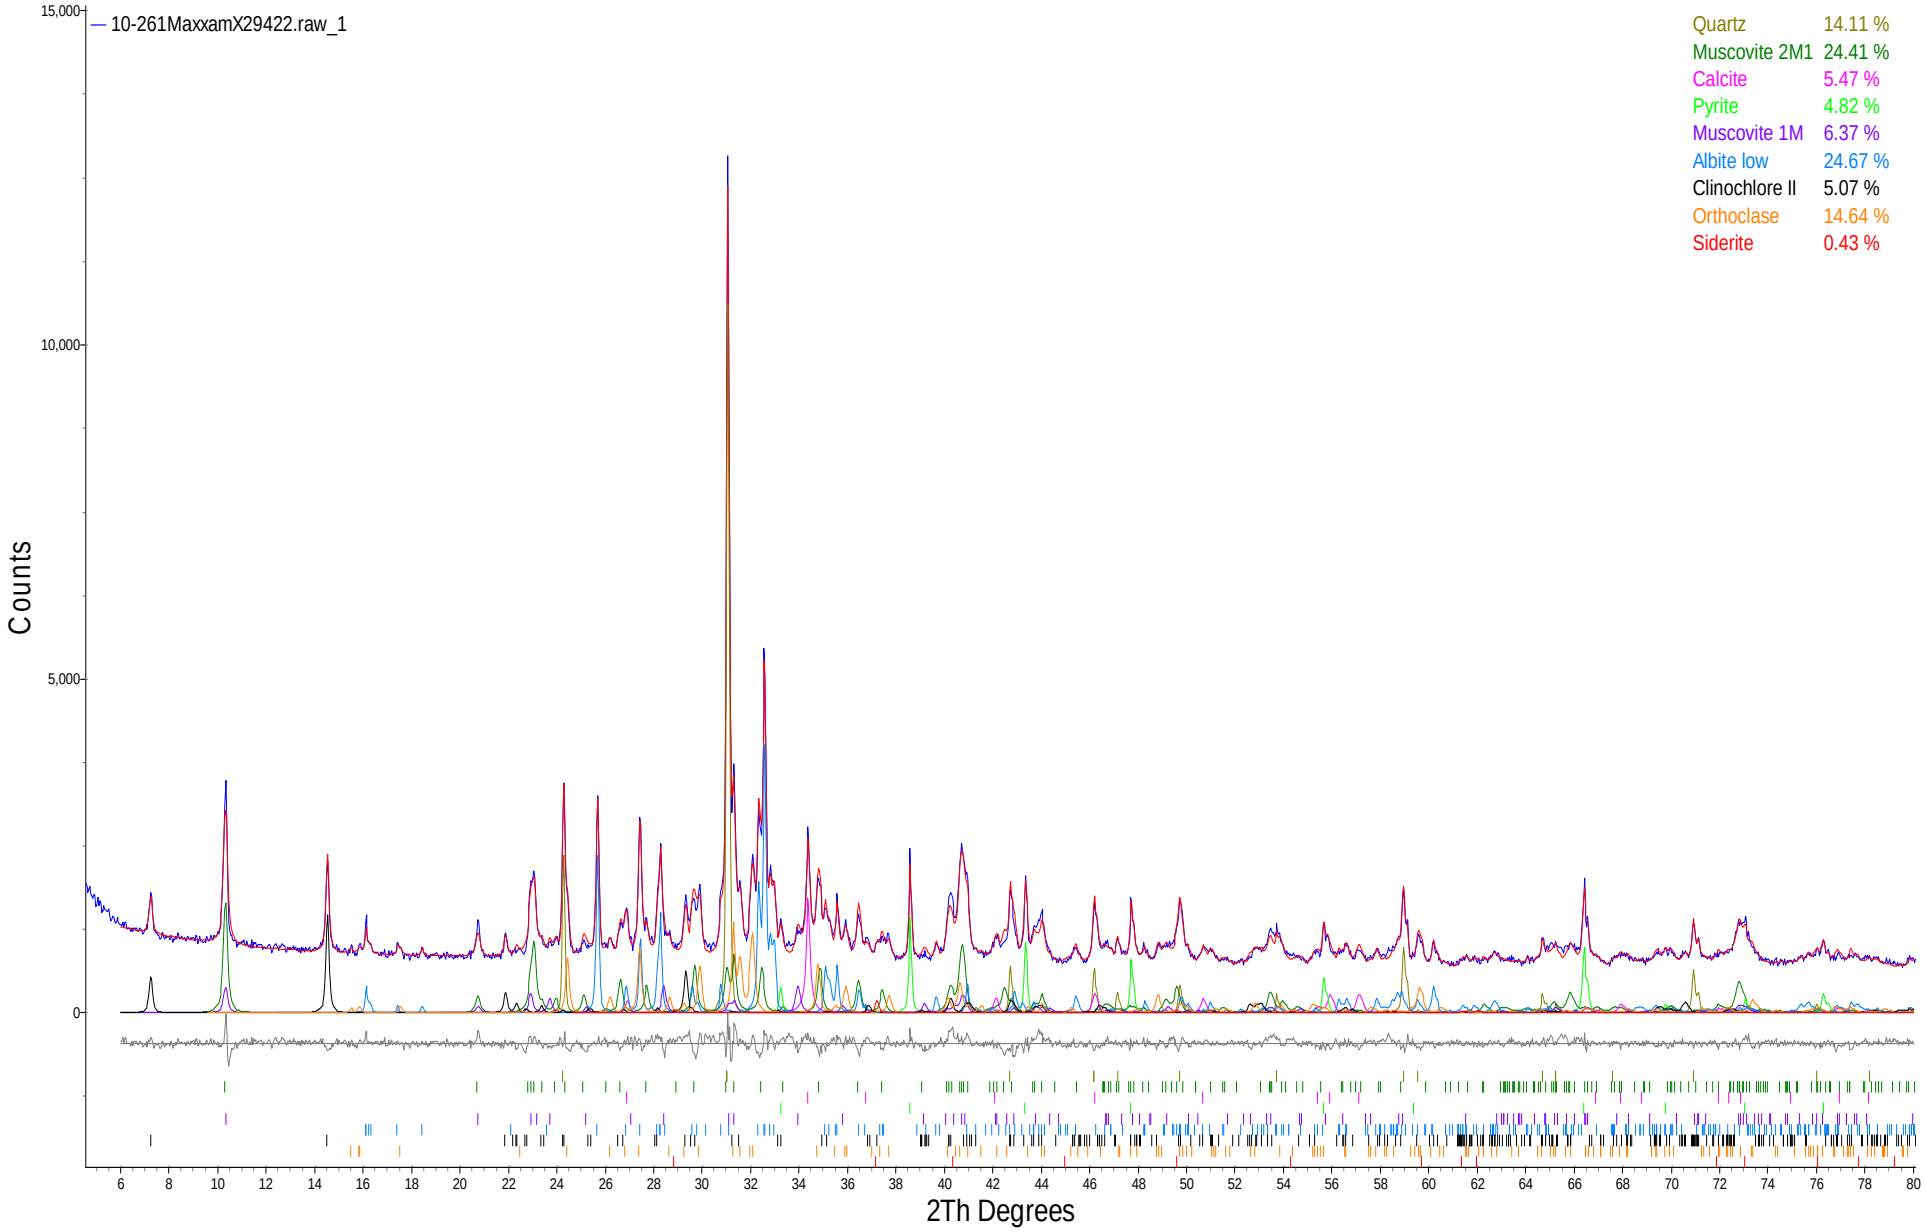

Figure 10. Rietveld refinement plot of sample **"X29422"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

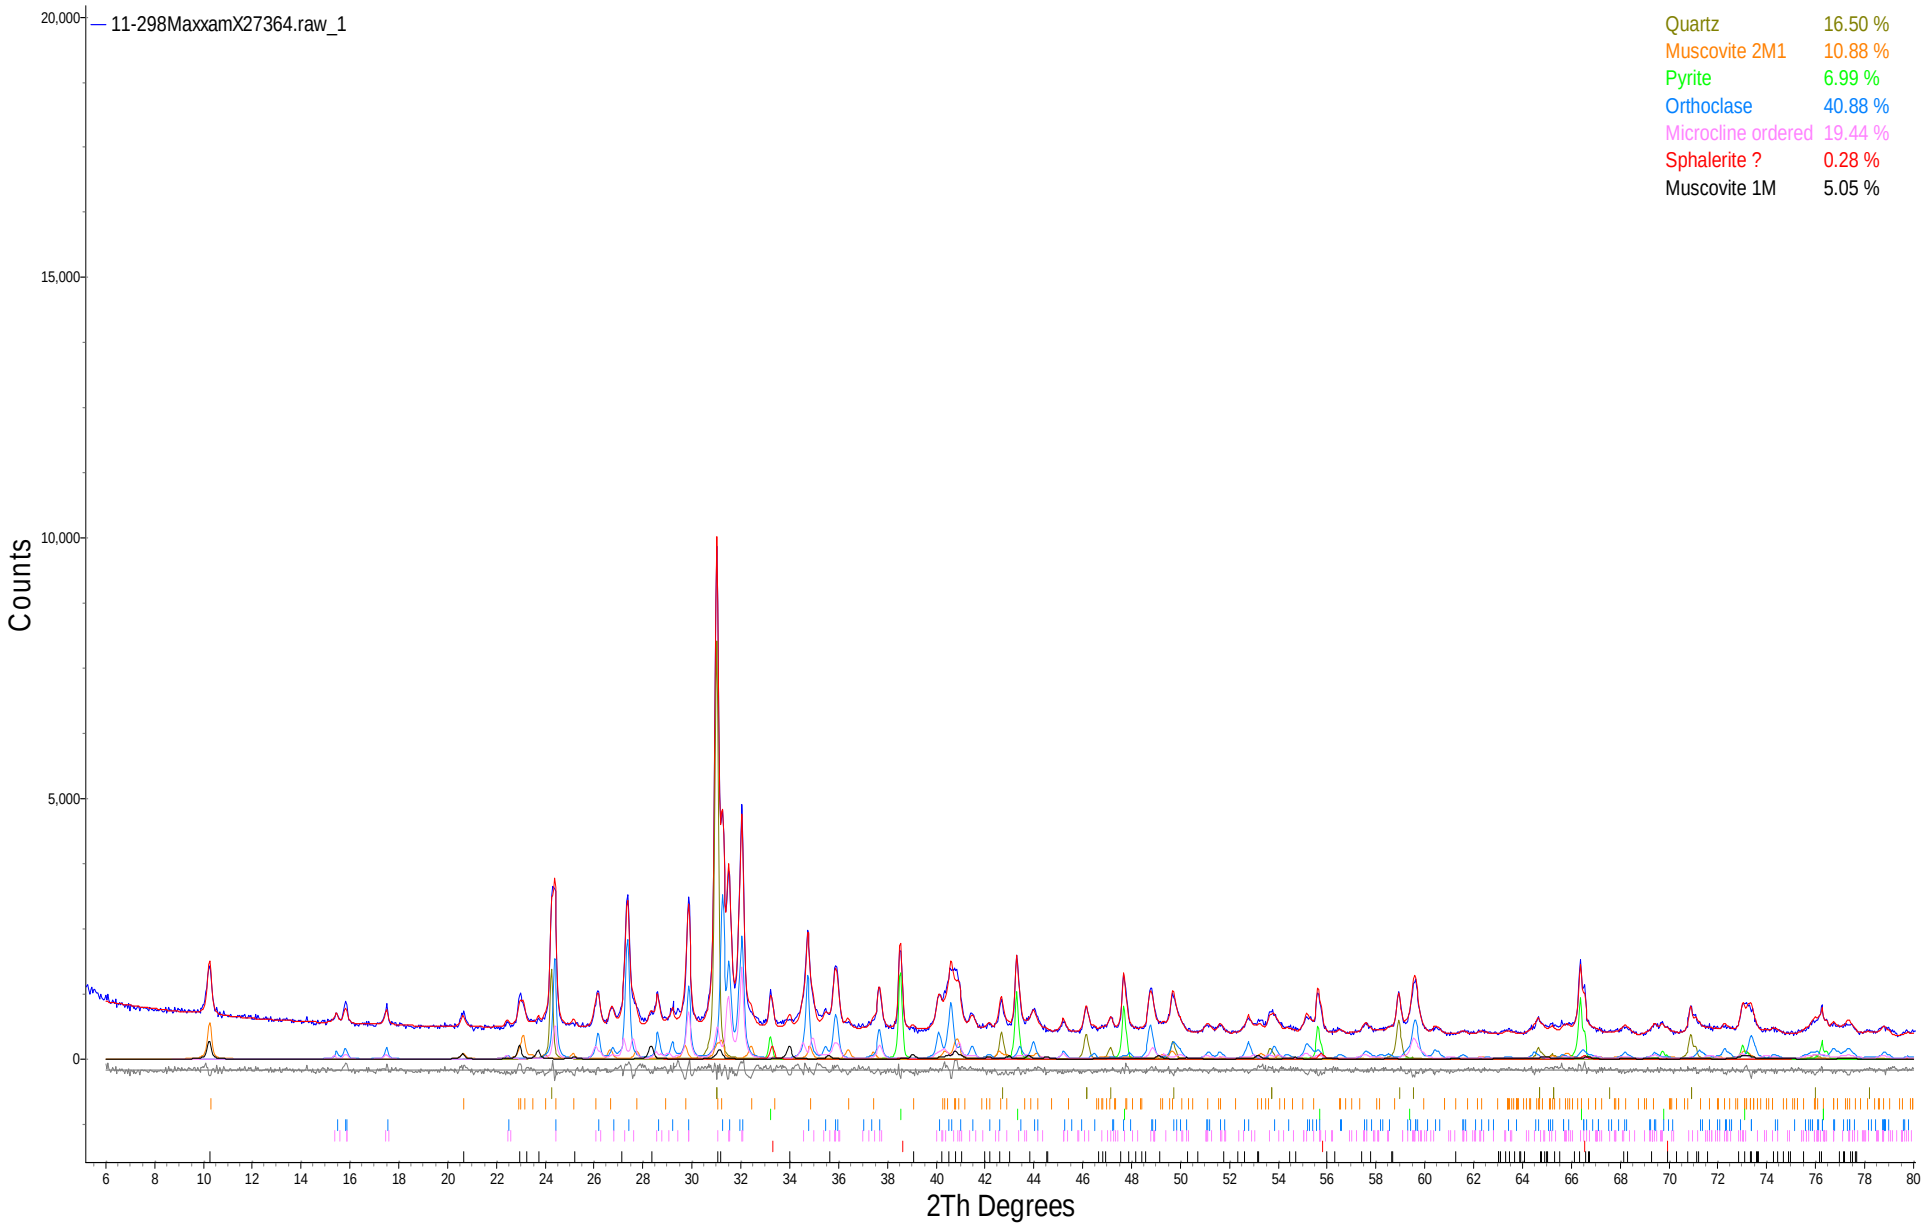

Figure 11. Rietveld refinement plot of sample **"X27364"** (blue line - observed intensity at each step; red line - calculated pattern; solid grey line below – difference between observed and calculated intensities; vertical bars, positions of all Bragg reflections). Coloured lines are individual diffraction patterns of all phases.

Engineers and Scientists

Appendix 5.1-3a. Petrographic Analysis Results at the Kerr, Sulphurets, and Mitchell Deposits

Sample	Lithology	Gangue Minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide Grain Boundaries
M-09-096 195.5-196.5	Quartz-sericite-schist	Lithic clasts of microcrystalline granular to foliated masses of sericite and variably internally deformed and recrystallized quartz grains with disseminated rutile grains; disseminated quartz mineral and illite grains/sheaves fragments	50% quartz; 35% illite; 10% pyrite, 1% rutile; 1% chalcopyrite; tr bornite; tr sphalerite	Liberated (5 µm - 1 mm in size) and disseminated (5-600 µm) in lithic clasts	Liberated (5-800 µm) and in clasts (5-500 µm); also as inclusions (<50 µm in size) and as fracture infill in pyrite	Common inclusions of bornite, enargite, sphalerite and tetrahedrite-tennantite in pyrite, all <0.05 mm in size; Disseminated tetrahedrite-tennantite in lithic clasts	Unaltered
M-09-097 52.5-53.5	Feldspar-amphibole porphyry	Microcrystalline to fine-grained lithic clasts, patchy (possibly clastic?) to porphyritic; Groundmass and phenocrysts variably made up of quartz + feldspars, sericite, chlorite + biotite; Amphibole suggested by diamond-shaped chlorite+ biotite pseudomorphs; disseminated apatite throughout; Lithic clasts and grain boundaries variably oxidized	55% quartz + feldspars; 15% biotite; 10% pyrite; 5% sericite; 5% chlorite; 3% chalcopyrite; 1% hematite, 1% apatite; 1% Fe-oxyhydroxides; tr rutile; tr enargite; tr digenite; tr covellite	Angular liberated (5-300 µm in size) grains and subhedral disseminated (5-800 µm) grains in clasts	Anhedral grains, liberated (5-300 µm) and in lithic clasts (5-100 µm); also as inclusions (<50 µm in size) in pyrite	Variably developed rims of Fe-oxyhydroxides around lithic clasts; rare inclusions of enargite in pyrite	Variably developed rims of hematite and Fe-oxyhydroxides around pyrite and of digenite/covellite around chalcopyrite; oxidation affects liberated grains and grains in lithic clasts
M-09-097 92.5-93.5	Feldspar porphyry + carbonate (± pyrite ± chalcopyrite) veins	1) Very fine-grained granular to porphyritic quartz-plagioclase-K-feldspar clasts with patches of chlorite (possible phenocrysts) and variably altered by sericite and carbonate; contain disseminated titanite, rutile and apatite and locally fine- to medium-grained anhedral quartz aggregates (quartz vein) ; 2) fine- to medium-grained granular carbonate-pyrite vein clasts	25% carbonate; 20% K-feldspar; 20% (quartz + plagioclase); 7% chlorite; 7% sericite; 7% pyrite; 1% apatite; 1% chalcopyrite; tr-1% magnetite; tr-1% titanite; tr-1% rutile; tr hematite	Typically disseminated (5 µm - 1 mm) in clasts, finer-grained in lithic clasts than in vein clasts; anhedral to subhedral; very rarely as liberated grains (5-200 µm in size)	Small anhedral grains (5-200 µm in size) in lithic clasts, locally associated with magnetite or titanite	Very fine-grained disseminated associated magnetite/hematite in lithic clasts	Pyrite grain boundaries commonly ragged and irregular
M-09-097 147.5-148.5	Feldspar porphyry + quartz (± carbonate ± chalcopyrite) veins	1) Very fine-grained granular to porphyritic quartz-plagioclase-K-feldspar clasts with coarse-grained disseminated K-feldspar phenocrysts; weakly altered by sericite and carbonate; contain disseminated chlorite, titanite, rutile and apatite and locally fine- to medium-grained anhedral quartz aggregates (quartz vein) ; 2) Medium-grained granular quartz-pyrite (-carbonate) vein clasts	30% K-feldspar; 30% (quartz + plagioclase); 10% chlorite; 5% sericite; 5% carbonate; 5% pyrite; 3% magnetite; 3% chalcopyrite; 1% apatite; 1% titanite; tr-1% rutile; tr enargite; tr chalcocite; tr sphalerite	Liberated (5 µm - 2.6 mm in size) and disseminated (5 µm - 1.2 mm) in clasts; typically anhedral	Small anhedral grains (5-300 µm in size) in lithic clasts or liberated (5-100 µm in size); also as inclusions and fracture infill in pyrite	Very fine-grained inclusions of enargite, chalcocite and sphalerite in pyrite; inclusions <50 µm in size	Unaltered
M-09-106 58.5-59.5	Sericite-quartz schist + quartz-carbonate-chlorite-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite and variably internally deformed and recrystallized quartz grains with disseminated rutile grains; lithic clasts of granular quartz and carbonate (+ chlorite + pyrite); disseminated quartz mineral and sericite, chlorite grains/sheaves fragments	40% quartz; 20% sericite; 15% carbonate; 10% chlorite; 12% pyrite, 1% chalcopyrite, 1% apatite; tr rutile, tr molybdenite, tr tetrahedrite-tennantite, tr bornite; tr sphalerite	Liberated (5 µm - 12mm in size) and disseminated (5 µm - 1.4 mm) in clasts	Liberated (5-100 µm) and in clasts (5-200 µm); also as inclusions (<100 µm in size) and as fracture infill in pyrite	Sporadic inclusions of bornite, sphalerite and tetrahedrite-tennantite in pyrite, all <0.1 mm in size; Tetrahedrite-tennantite in fractures in pyrite with chalcopyrite; Sheaves of molybdenite (0.1 -0.3 mm), liberated and in clasts	Unaltered
M-09-106 34.5-35.5	Chlorite-sericite-quartz schist + quartz-carbonate-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite, foliated chlorite and variably internally deformed and recrystallized quartz grains with disseminated rutile grains; Lithic clasts of granular quartz and interstitial carbonate (± pyrite); disseminated quartz and carbonate mineral fragments and of sericite, chlorite grains/sheaves fragments	40% quartz; 5% carbonate; 30% sericite; 15% chlorite; 8% pyrite, 1% chalcopyrite, tr rutile; tr sphalerite	Liberated (5 µm - 0.5mm in size) and disseminated (5 µm - 1 mm) in clasts	Liberated (5-100 µm) and in clasts (5-200 µm); also as inclusions (<60 µm in size), overgrowths and fracture infill in pyrite	Rare inclusions of sphalerite in pyrite	Unaltered
M-09-108 56.5-57.5	Feldspar porphyry + carbonate-quartz veins	Altered porphyritic clasts made up of fine-grained quartz (+ feldspar) groundmass with disseminated apatite, chlorite, carbonate; phenocrysts of K-feldspars and plagioclase locally preserved from sericite + chlorite alteration; patches of chlorite + sulphides throughout (former phenocrysts?); coarser-grained carbonate in thin veinlets in clasts and as monomineralic vein fragments; local Fe-oxyhydroxide rims and stain in clasts	55% quartz + feldspars; 12% carbonate; 10% chlorite; 10% sericite; 7% pyrite, 2% chalcopyrite, 1% apatite; tr rutile; tr sphalerite; tr covellite; tr hematite; tr Fe-oxyhydroxides	Anhedral grains, variably poikilitic, disseminated (5 µm - 1.4 mm in size) in lithic clasts	Anhedral grains (5-100 µm) disseminated in clasts	Anhedral grains and masses of sphalerite (5 µm - 1 mm) in lithic clasts	Sporadic covellite rims around sphalerite or chalcopyrite; local rims of hematite around pyrite or chalcopyrite
M-09-108 118.5-119.5	Feldspar porphyry	Fine- to medium-grained plagioclase and K-feldspar phenocrysts in a very fine-grained groundmass of feldspars + quartz, variably altered by sericite and carbonate; possible mafic phenocrysts pseudomorphed by rutile + sericite; most altered clasts similar to sericite schists; cut by variably thick fine-grained carbonate (+ quartz) veinlets	45% quartz + feldspars; 25% sericite; 15% pyrite; 10% carbonate; 2% chlorite; tr chalcopyrite; tr rutile; tr enargite; tr apatite	Anhedral grains, typically disseminated (5-800 µm) in clasts or rarely liberated (5-800 µm in size)	Rare small anhedral grains in clasts (5-50 µm); also as inclusions (<50 µm in size) and as fracture infill in pyrite	Rare inclusions of enargite (<50 µm) in pyrite	Unaltered
M-09-108 162.5-163.5	Sericite schist	Patchy fine- to very fine-grained clasts of granular quartz (and possibly feldspars), carbonate, foliated sericite and chlorite; local attachments of coarser-grained quartz or carbonate suggesting vein material; Liberated quartz, feldspars and carbonate mineral fragments and sericite, chlorite sheaves	40% quartz + feldspars; 30% sericite; 10% chlorite; 7% pyrite; 7% carbonate; 1% chalcopyrite; tr rutile; tr enargite; tr apatite; tr hematite; tr sphalerite	Anhedral grains, disseminated (5 µm- 1mm) in clasts or liberated (5-400 µm in size)	Anhedral grains (5-80 µm) in clasts; also as inclusions (<50 µm in size), overgrowths, attachments and as fracture infill in pyrite	Inclusions of enargite, sphalerite and hematite in pyrite; all inclusions <50 µm	Unaltered
M-09-108 184.5-185.5	Sericite schist + quartz-carbonate-pyrite veins	Lithic clasts of microcrystalline granular to fine-grained foliated masses of sericite, foliated chlorite and disseminated quartz, carbonate, rutile, opaque (Fe, Ti)-oxides and apatite; Lithic clasts of granular quartz and carbonate (+ pyrite); disseminated quartz and carbonate mineral fragments and of sericite, chlorite grains/sheaves fragments.	70% sericite; 15% quartz; 10% chlorite; 5% carbonate, 15% pyrite, 1% chalcopyrite, tr rutile, tr (Fe, Ti)-oxides; tr apatite; tr molybdenite; tr tetrahedrite-tennantite; tr sphalerite	Liberated (5-750 µm in size) and disseminated (5-200 µm) in lithic clasts	Liberated (5-100 µm) and in clasts (5-80 µm); also as inclusions (<50 µm in size) and as fracture infill in pyrite and as pyrite overgrowths	Rare inclusions of sphalerite and tetrahedrite-tennantite in pyrite; molybdenite (10-200) occurring liberated or as attachments to pyrite	Unaltered
M-09-102 120.5-121.5	Feldspar porphyry	Patchy to vaguely porphyritic fine- to very fine-grained clasts of granular quartz, feldspars, carbonate, foliated sericite and chlorite; local thin carbonate veins throughout clasts	40% feldspars; 20% quartz; 15% sericite; 15% carbonate; 5% pyrite; 1% chlorite; 1% rutile; 1% apatite; tr chalcopyrite, tr enargite; tr tetrahedrite-tennantite; tr sphalerite	Disseminated subhedral grains (5-600 µm) in lithic clasts; less commonly as anhedral masses in clasts	Anhedral grains (5-100 µm) in clasts; also as inclusions, attachments and fracture infill in pyrite	Rare inclusions of rutile, sphalerite and tetrahedrite-tennantite in pyrite; all inclusions < 50 µm in size	Unaltered

Appendix 5.1-3a. Petrographic Analysis Results at the Kerr, Sulphurets, and Mitchell Deposits

Sample	Lithology	Gangue Minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide Grain Boundaries
M-09-102A 125.5-126.5	Feldspar porphyry	Granular to porphyritic very fine-grained clasts of granular quartz, feldspars, carbonate and foliated sericite	35% feldspars; 20% quartz; 15% sericite; 15% carbonate; 12% pyrite; 1% rutile; tr apatite; tr chalcopyrite, tr tetrahedrite-tennantite, tr zircon; tr sphalerite	Disseminated anhedral to subhedral grains (5-800 µm) in lithic clasts; very rare inclusions (< 30 µm in size) in chalcopyrite	Anhedral grains (5-200 µm) in clasts; rarely as inclusions (< 30 µm) in pyrite	Few inclusions of sphalerite and tennantite in chalcopyrite; none in pyrite	Unaltered
M-09-102A 133.5-134.5	Undetermined	Granular very fine-grained to microcrystalline clasts, locally containing ill-defined phenocrysts; Clast groundmass made up of granular quartz and feldspars with disseminated carbonate and sericite; Cut by variably thick carbonate veinlets	60% (quartz + feldspars); 20% carbonate; 10% sericite; 5% pyrite; 1% rutile; 1% apatite; tr-1% chalcopyrite; tr sphalerite	Disseminated anhedral to subhedral grains (5-400 µm) in lithic clasts	Anhedral grains (5-25 µm) in clasts; rarely as inclusions (< 25 µm) or attachments to pyrite; disseminated, extremely fine-grained (<30 µm) in a carbonate vein in a clast	Few inclusions of sphalerite in pyrite	Unaltered
M-09-110 34.5-35.5	Undetermined	Granular very fine-grained to microcrystalline clasts; Clast groundmass made up of granular quartz and feldspars with disseminated carbonate, sericite, chlorite, rutile, apatite, titanite and sulphides; Possible quartz and feldspar phenocrysts present but extensively internally deformed or recrystallized; Fine-grained biotite/sericite dissemination in some lithic clasts; Lithic clasts locally cut by thin carbonate veinlets and with patches of malachite; Lithic clasts variably stained and rimmed by Fe-oxyhydroxides	60% (quartz + feldspars); 15% biotite; 5% carbonate; 5% sericite; 5% chlorite;1-2% hematite; 1-2% pyrite; 1% rutile; 1% chalcopyrite; 1% apatite; 1% Fe-oxyhydroxides; 1% titanite; tr magnetite; tr covellite;	Disseminated anhedral to euhedral grains (5-300 µm) in lithic clasts	Anhedral grains (5-200 µm) in lithic clasts and rare inclusions in pyrite	Anhedral grains of sphalerite (5-300 µm in size) and anhedral to subhedral grains of hematite (5-100 µm) disseminated in clasts; few granular clusters of magnetite	Rims of Fe-oxyhydroxides developed around lithic clasts and around sulphides / hematite and associated with covellite; disseminated hematite
M-09-110 88.5-89.5	Undetermined + carbonate veins + quartz veins	Granular very fine-grained clasts with locally preserved extensively internally deformed feldspar and quartz phenocrysts, locally possible clastic texture; Clast groundmass made up of granular quartz and feldspars with disseminated carbonate, biotite, sericite, chlorite, rutile, apatite and sulphides; Lithic clasts locally cut by thin carbonate veinlets; rare coarse-grained quartz or carbonate grain fragments suggest quartz or carbonate vein fragments	50% (quartz + feldspars); 20% biotite; 7% carbonate; 5% sericite; 5% chlorite; 5% pyrite; 2% rutile; 2% chalcopyrite; 2% apatite; tr enargite	Anhedral to subhedral grains (5-300 µm in size) in lithic clasts	Anhedral grains (5-200 µm in size) in lithic clasts; rare inclusions (<50 µm in size) in pyrite; local corona around pyrite	Inclusions (<25 µm in size) of possible enargite in pyrite	Unaltered
M-09-110 342.5-343.5	Sericite-quartz schist + quartz-carbonate-chlorite-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite (+ chlorite) and variably internally deformed quartz; Disseminated rutile in lithic clasts; Disseminated quartz and carbonate mineral fragments and sericite and chlorite sheaves.	25% sericite; 35% quartz; 5% chlorite; 30% pyrite, 1% chalcopyrite, tr rutile; tr molybdenite; tr tetrahedrite-tennantite	Mostly liberated (5 µm - 2 mm in size) and less commonly disseminated (5-600 µm) in lithic clasts	Rare irregularly shaped inclusions (<100 µm in size) in pyrite	-	Unaltered
M-09-112 224.5-225.5	Anhydrite-quartz-sericite schist + quartz-carbonate-chlorite-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite with disseminated grains and patches of quartz, feldspars and anhydrite; disseminated clusters of rutile; coarser-grained quartz and carbonate in veins in clasts and as liberated vein fragments; liberated quartz, feldspars, chlorite and sericite	40% sericite; 35% (feldspars + quartz); 7% pyrite, 7% anhydrite; 3% carbonate; 1% chalcopyrite, 1% rutile; 1% apatite; tr bornite; tr chalcocite; tr sphalerite	Disseminated anhedral grains (5 µm - 1 mm) in lithic clasts	Anhedral grains (5-100 µm) in clasts; also as inclusions (<75 µm in size) and overgrowths in pyrite	Inclusions (<75 µm in size) of bornite, sphalerite and chalcocite in pyrite	Unaltered
K-09-01 84.5-85.5	Sericite schist + quartz-carbonate-chlorite-pyrite-chalcopyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite/chlorite with disseminated grains and patches of quartz and feldspars, clusters of rutile and grains of apatite; coarser-grained quartz and carbonate in veins in clasts and as liberated vein fragments; liberated quartz, feldspars, chlorite and sericite	45% sericite; 15% (feldspars + quartz); 15% chlorite; 10% pyrite, 5% carbonate; 2% chalcopyrite, 2% rutile; 2% Fe-oxyhydroxides; 2% apatite; tr enargite; tr chalcocite, tr bornite	Anhedral to subhedral grains, liberated (5-600 µm in size) and disseminated (5 µm - 1 mm) in lithic clasts	Anhedral grains and masses (5-200 µm) in clasts or liberated (5-500 µm). Also as inclusions (<50 µm in size) in pyrite	Rounded inclusions of enargite, bornite (<200 µm) in pyrite and elongated inclusions (< 75 µm long) of possible chalcocite; Anhedral masses of Fe-oxyhydroxides, typically liberated, rarely in schist clasts	Anhedral masses of Fe-oxyhydroxides, liberated or occurring in schist clasts and preserving bits of pyrite
K-09-02 66.5-67.5	Sericite-quartz schist	Extremely thin section; Lithic clasts of microcrystalline granular to foliated masses of sericite and variably internally deformed quartz; Disseminated rutile in lithic clasts; Disseminated quartz mineral fragments and sericite sheaves.	35% quartz; 25% sericite; 30% pyrite; 3% chalcocite; 2% chalcopyrite; 2% apatite; 1% rutile; tr covellite	Liberated (5-900 µm in size) and disseminated (5-400 µm) in lithic clasts	Mostly as overgrowths, fracture infill and inclusions (<100 µm in size) in pyrite; also disseminated (5-400 µm) in clasts or liberated (5-100 µm)	Liberated chalcocite (5-600 µm); groundmass of chalcocite in one lithic clast; Inclusions and overgrowths of chalcocite associated with chalcopyrite in pyrite; covellite as local rims and fracture infill around Cu-sulphides	Local partial to complete rims and fracture infill of covellite around chalcopyrite / chalcocite
K-09-03 140.5-141	Sericite-quartz schist + quartz-carbonate(-pyrite-chalcopyrite) veins	Lithic clasts of microcrystalline granular to foliated masses of sericite (+ chlorite) and variably internally deformed quartz; Disseminated rutile and apatite in lithic clasts; Fine-grained granular lithic clasts of quartz (+carbonate). Disseminated quartz and carbonate grain fragments and sericite sheaves.	45% quartz; 25% sericite; 20% pyrite; 5% chlorite; 2% carbonate; 2% chalcopyrite; 1% apatite; tr rutile; tr bornite; tr enargite	Liberated (5 µm - 1 mm in size) and disseminated (5 µm-1.2 mm) in lithic clasts	Overgrowths, fracture infill and inclusions (<100 µm in size) in pyrite; Masses liberated (5-200 µm in size) or set (5-400 µm) in lithic clasts	Bornite, enargite and possible rutile inclusions in pyrite; all inclusions < 50 µm in size	Unaltered
K-09-04 126.5-127.5	Sericite-quartz schist + quartz(-carbonate-pyrite-chalcopyrite) veins	Lithic clasts of variably internally deformed quartz with disseminated masses of microcrystalline granular to foliated sericite (+ chlorite); Disseminated rutile and apatite in lithic clasts; Fine-grained monomineralic lithic quartz clasts. Disseminated quartz mineral fragments and sericite sheaves.	40% quartz; 30% pyrite; 20% sericite; 5% chlorite; 2-3% chalcopyrite; 1% apatite; tr rutile; tr bornite; tr enargite	Liberated (5 µm - 1.6 mm in size) and disseminated (5 µm - 2 mm) in lithic clasts	Overgrowths, fracture infill and inclusions (<100 µm in size) in pyrite; Liberated (5-200 µm in size) and disseminated (5 µm 1 mm) in lithic clasts	Bornite, enargite and possible rutile inclusions in pyrite; all inclusions < 50 µm in size	Unaltered
S-08-06 252.5-253.5	Feldspar porphyry + quartz ± carbonate veins	Variably altered porphyritic clasts, made up of fine-grained granular quartz and feldspars and coarser-grained feldspar phenocrysts; chlorite, apatite and rutile disseminated in the groundmass; variably altered by sericite and carbonate; Some carbonate(+quartz) veins in clasts	45% (quartz + feldspars); 25% chlorite; 10% sericite; 7% carbonate; 5% pyrite; 2% chalcopyrite; 2% rutile; 1% apatite; tr molybdenite	Disseminated anhedral to subhedral grains (5-600 µm) in lithic clasts; one liberated subhedral grain 0.3 mm in size	Anhedral grains (5-200 µm) in vein clasts	One elongated mass (1 mm long) of molybdenite sheaves in a clast	Unaltered

CONDITIONS AND DISCLAIMER

This report is issued subject to the following conditions:

This report has been prepared on the basis of information as described in Section 1 below. Other than as specifically noted in this report, Mineral Services Canada (MSC) has not conducted any work to verify the source, accuracy or completeness of information provided, and is not responsible for any shortcomings in these regards.

Discussions, conclusions and / or summaries are presented to assist the reader in highlighting key points; however they cannot be interpreted in isolation and must be considered with reference to and in the context of the body of the report.

Any reports, maps, graphs, logs or other information of a geological nature or otherwise, generated by MSC and contained in this report or submitted separately ("the information"), may be used for general information purposes only by the Client to whom the information is addressed. For other uses of the information, such as public disclosure, press releases, regulatory requirements, share exchange, financing and so forth, permission must first be obtained in writing from MSC.

Any quotations, excerpts and references from the report must be made in such a manner that their meaning and intent are not materially changed from the meaning and intent as contained in the report.

MSC will not be held liable for loss or damages resulting from work undertaken or reported in terms of this assignment, or decisions taken on the basis of such work and / or reporting.

PETROGRAPHY OF TWENTY SIX SAMPLES FROM THE KERR-SULPHURETS-MITCHELL (KSM) GOLD-COPPER PROJECT (B.C.)

1. INTRODUCTION

This report presents the results of petrographic analyses of twenty six samples received from Keith Mountjoy of Rescan Environmental services. The samples were submitted, prior to humidity cell testing, as crushed material and no detailed geologic or spatial information was provided with the samples. The samples were collected in the Kerr (4 samples), Sulphurets (5 samples) and Mitchell (17 samples) deposits defining the project. The aim of the study was to characterize the mineralogy of the samples, focusing on carbonate, sulphides and oxides.

Table 1: List of samples examined as part of this investigation.

SAMPLE	SAMPLE NAME	DEPOSIT
1	M-09-096 195.5-196.5m	MITCHELL
2	M-09-097 52.5-53.5m	MITCHELL

2. METHODS

Petrographic descriptions were performed in the office of Mineral Services Canada Inc. using a Nikon Eclipse E400 microscope equipped with transmitted and reflected light. The microscopic characteristics of the samples are described in Appendix A and are included with the hand sample descriptions of the samples in a separate Excel file (MSC10-016R.xls). A series of representative photomicrographs are presented in Appendices B, C and D. The main characteristics of the samples are described below.

3. RESULTS

3.1. MITCHELL ZONE

Samples from the Mitchell zone are represented in samples 1 to 17. The sample suite includes samples classified as a variety of schists (samples, 1, 5, 6, 9, 10, 16 and 17), possibly brecciated feldspar porphyries (samples 2, 3, 4, 7, 8, 11 and 12) and samples of undetermined origin (samples 13, 14 and 15).

3.1.1. GANGUE MINERALS

Schist samples

The schist samples consist of lithic clasts made up of various amounts of schistose bands of sericite (± chlorite) that either alternate with bands of felsic minerals (quartz and lesser amounts of feldspars) or wrap around grains and clusters of felsic minerals or of pyrite. Felsic minerals are typically extensively internally deformed, strained or recrystallized. Carbonate is variably associated with felsic minerals in most samples, and anhydrite occurs in sample 17 as disseminated grains within felsic layers and bands.

The amount of felsic minerals present in the clasts is highly variable (15% in sample 10 to 50% in sample 1) and the samples are variably referred to as sericite-quartz schists (samples 1, 5 and 16), chlorite-sericite-quartz schists (sample 6), sericite schist (samples 9 and 10) and anhydrite-quartz-sericite (sample 17). Apatite and rutile are disseminated in all samples.

Schist clasts are cut by thin veinlets and clasts of possible vein material also occur throughout the schist samples, except in sample 1. The vein material (in schist and vein clasts) typically consists of quartz ± carbonate ± pyrite ± chalcopyrite. The grain size of the vein material is typically coarser than the one of the schist hostrock and quartz and carbonate can be extremely stretched and strained. In sample 6, pyrite and carbonate are interstitial to quartz.

Porphyritic samples

Samples 2, 3, 4, 7, 8, 11 and 12 are interpreted as feldspar porphyries. They consist of a very fine-grained groundmass of quartz and feldspars and contain feldspar phenocrysts. Both the groundmass and phenocrysts are variably altered, typically replaced by sericite ± carbonate ± chlorite. Mafic phenocrysts are not present, but chlorite ± sulphides ± rutile ± biotite ± sericite pseudomorphs occur. A diamond shaped pseudomorph is recognized in sample 2 suggesting that it replaces amphibole. Rutile and apatite are disseminated in all samples, with titanite additionally occurring in samples 3 and 4.

In the samples most altered by sericite, clasts locally have a well-developed schistose texture (sample 8) but faint brecciated textures are also recognized in some samples.

Variably thick carbonate veinlets cut lithic clasts in samples 3, 7, 8 and 11. In sample 3 and 7, grain fragments and granular clasts of medium- to coarse-grained carbonate suggest carbonate vein fragments (pyrite-hosting in sample 3). Medium-grained liberated quartz (samples 2, 3 and 4) or quartz grains and granular fragments additionally suggest possible fragments of quartz veins in these samples. In sample 4, carbonate and pyrite occur interstitial to quartz in the quartz vein clasts.

Undetermined samples

These samples are represented in samples 13, 14 and 15 and essentially consist of fine- to very fine-grained, granular to patchy lithic clasts made up of quartz, feldspar, sericite and carbonate with additional biotite and chlorite in samples 14 and 15. Minor amounts of apatite and rutile also occur in all samples. Subtle fragmental textures are locally observed in some clasts.

Thin carbonate veinlets locally cut the lithic clasts (samples 13 and 15) and medium-grained liberated quartz (samples 14 and 15) or carbonate (samples 13 and 15) grains and granular fragments suggest possible fragments of quartz veins or carbonate veins, respectively.

3.1.2. CARBONATE

Carbonate occurs in all samples except in samples 1, 2 and 16. Its abundance varies from 3% in sample 17 to 25% in sample 3. Carbonate is typically colourless (likely calcite) except in samples 11, 12 and 13 in which it is brownish and pleochroic (possible dolomite/ankerite). In sample 5, both colourless and brownish carbonates are observed and in sample 14, green malachite is associated with colourless carbonate.

The carbonates occur as anhedral to strongly elongated grains in thin veins cutting lithic clasts or in clasts of vein material. They also occur as small alteration patches disseminated in the lithic clasts of most carbonate-bearing samples.

3.1.3. OPAQUE MINERALS

Pyrite and lesser chalcopyrite are the dominant sulphides and occur in all samples. Bornite, enargite, sphalerite, chalcocite, possible tetrahedrite-tennantite, covellite and molybdenite additionally variably occur throughout the samples, in amounts close to or below 1%.

Pyrite abundance varies from 1-2% in sample 14 to approximately 30% in sample 16. Pyrite typically occurs as anhedral to subhedral grains disseminated in lithic clasts as well as disseminated in vein clasts (samples 3 and 4). In clasts, it varies in size from 5 µm to 1.4 mm. Pyrite also occurs as subangular liberated grains, 5 µm to 2.6 mm in size. Sulphides inclusions are common in pyrite and variably consist of chalcopyrite, bornite, enargite, sphalerite, tetrahedrite-tennantite, rutile and hematite. Inclusions are typically less than 50 µm in size.

The abundance of chalcopyrite varies from trace in samples 8, 11 and 12 to approximately 3% in samples 2 and 4. Chalcopyrite occurs as liberated grains (samples 1, 4, 5, 6 and 10), as anhedral grains set in the hostrock of lithic clasts (all samples except sample 8), or in veins (either in lithic clasts or vein clasts) in samples 4, 8, 9, 10, 14 and17. It also commonly occurs as inclusions in pyrite and rarely as fracture infill and coating around pyrite. In sample 12, chalcopyrite contains rare inclusions of sphalerite and tetrahedrite-tennantite.

Bornite (samples 1, 5 and 17), enargite (samples 1, 2, 4, 8, 9 and 15), sphalerite (samples 1, 4, 5, 6, 9, 10, 11, 13 and 17), possible tetrahedrite-tennantite (samples 1, 5, 10 and 11) and chalcocite (samples 4 and 17) occur as inclusions in pyrite. Sphalerite and tetrahedrite-tennantite occur as inclusions in chalcopyrite in sample 12. The inclusions (in pyrite and chalcopyrite) are typically very small (< 50 µm in size), making definitive identification difficult.

Tetrahedrite-tennantite also occurs in lithic clasts in sample 1 or in fractures in pyrite associated with chalcopyrite (sample 5). Sheaves of molybdenite occur liberated, in lithic clasts or as attachments to pyrite in samples 5 and 10. In sample 7 and 14, grains and masses of sphalerite occur in lithic clasts.

Grain boundaries of all sulphides are typically unaltered. However, in samples 2, 7 and 14, rims of hematite ± Fe-oxyhydroxides are variably developed around pyrite (and chalcopyrite in samples 7 and 14) as well as rims of covellite ± digenite ± Fe-oxyhydroxides around chalcopyrite. In sample 7, sporadic covellite rims are additionally observed around sphalerite. In sample 14, Fe-oxyhydroxides also occur as thin coating around lithic clasts.

Magnetite is disseminated in clasts in samples 3 and 14.

3.2. KERR ZONE

3.2.1. GANGUE MINERALS

Samples from the Kerr zone are represented in samples 18 to 21. The samples are classified as chlorite-sericite schists (sample 18) and sericite-quartz schists (samples 19, 20 and 21). The latter samples essentially consist of lithic clasts made up of schistose bands of sericite and variable amounts of chlorite wrapping around internally deformed or recrystallized grains and clusters of quartz or around subhedral grains of pyrite. In sample 18, no quartz is observed and lithic fragments are essentially made up of schistose sericite and lesser chlorite. Fine-grained apatite and very fine-grained rutile are disseminated in all samples. Thin veinlets occur in lithic clasts in samples 18, 20 and 21 as

well as coarser-grained granular vein clasts. The vein material in lithic and vein clasts is made up of quartz-carbonate-chlorite-pyrite-chalcopyrite in sample 18 and of quartz-carbonate-pyrite-chalcopyrite in samples 20 and 21.

3.2.2. CARBONATES

Carbonate occurs in samples 18, 20 and 21. No carbonate is observed in sample 19. The abundance of carbonate is close to 5% in sample 18, close to 1% in sample 20 and below 1% in sample 21. In all samples, carbonate is colourless and essentially occurs as anhedral grains and clusters of vein material in lithic or vein clasts.

3.2.3. OPAQUE MINERALS

In all four samples, pyrite is the dominant sulphide. Its abundance is close to 10% in sample 18, 20% in sample 20 and 30% in samples 19 and 21. Pyrite typically forms anhedral to subhedral grains (5 µm to 2 mm in size) that occur associated with quartz and sericite in lithic clasts as well as disseminated in vein clasts (except in sample 19 in which no vein material is observed). Pyrite also occurs as subangular liberated grains, 5 µm to 1.6 mm in size.

Chalcopyrite occurs in all samples in amounts close to 2-3%. It forms liberated grains (5 -500 µm in size) and anhedral grains (5 µm to 1 mm in size) in lithic clasts (samples 18, 19 and 20) or in vein clasts (samples 18, 20 and 21). In samples 19, 20 and 21, chalcopyrite also commonly occurs as overgrowths, fracture infill and inclusions in pyrite.

Other sulphides are variably present throughout the samples and occur in amounts ranging from trace to 3%. They consist of enargite, bornite, chalcocite and covellite.

Enargite and bornite occur in all samples as inclusions in pyrite in addition to chalcopyrite, rutile, possible chalcocite (in sample 18 only) and associated chalcopyrite/chalcocite in sample 19.

Chalcocite and covellite essentially occur in sample 19. Chalcocite forms liberated masses and masses associated with chalcopyrite in vein clasts. It also occurs as inclusions and overgrowths in and around chalcopyrite. Covellite sporadically forms partial rims and fracture infills in and around chalcopyrite/chalcocite.

The sulphide grain boundaries are typically unaltered, except in samples 18 and 19. In sample 18, masses of Fe-oxyhydroxides are observed that locally preserve blebs of pyrite. The masses of Fe-oxyhydroxides are liberated or less commonly enclosed in lithic clasts. In sample 19, masses of chalcopyrite/chalcocite are variably coated by covellite around grain boundaries and fractures.

3.3. SULPHURETS ZONE

3.3.1. GANGUE MINERALS

Samples from the Sulphurets zone are represented in samples 22 to 26. Three types of samples are recognized: sample 22 is of feldspar porphyry, samples 23 and 24 are of sericite schists and quartz ± chlorite ± carbonate veins and samples 25 and 26 are of brecciated feldspar porphyry.

In sample 22, lithic clasts are porphyritic, made up of fine-grained granular quartz and feldspars and coarser-grained feldspar phenocrysts. Feldspars are variably altered to secondary K-feldspar and pitted by sericite and carbonate. Masses of chlorite that are associated with sulphides or rutile occur throughout the clasts and likely represent altered mafic phenocrysts. Apatite is disseminated throughout the lithic clasts that are on some occasions cut by fine-grained veinlets of carbonate + chalcopyrite (+ quartz). A faint fragmental texture is recognized in rare clasts.

In samples 23 and 24, lithic clasts essentially consist of schistose bands of sericite and variable amounts of chlorite. Microcrystalline quartz (and possibly feldspars) is disseminated throughout the sericite-chlorite bands, as are clusters of rutile and grains of apatite. Granular clusters of carbonate ± quartz ± chlorite that likely represent vein material occur as attachments to lithic clasts and as vein fragments. This vein material is typically barren of sulphides.

In samples 25 and 26, fragments are typically porphyritic, but sharp variations of the groundmass grain sizes and textures (anhedral microcrystalline to lath-like, fine-grained) as well as the occurrence of ribbons of chlorite (+carbonate) lining porphyritic clusters suggest that lithic clasts are brecciated. Groundmass and phenocrysts are made up of feldspars (and likely minor quartz although quartz and feldspars cannot be resolved due to the very fine grain size) that are variably altered by secondary K-feldspar and carbonate. Patches and ribbons of chlorite and chlorite + carbonate occur in lithic clasts and the matrix of the brecciated clasts is of chlorite and carbonate. Rutile is disseminated in lithic clasts and these are commonly cut by variably thin carbonate veinlets.

3.3.2. CARBONATES

Carbonate occurs in all five samples, in amounts ranging from 5% in sample 23 to 20% in sample 24. Carbonate is typically colourless (calcite) although a darker variety (possible dolomite or ankerite) occurs in sample 23. In sample 22, 23 and 24, carbonate occurs in granular vein clasts made up of carbonate and quartz (sample 22), of dark carbonate ± quartz ± chlorite (sample 23) or of carbonate ± chlorite (sample 24). In all samples, carbonate also occurs as small granular veins in lithic clasts. In the porphyritic to clastic samples (samples 22, 25 and 26) carbonate additionally occurs as alteration product of feldspars.

3.3.3. OPAQUE MINERALS

Pyrite and chalcopyrite are the only sulphides that occur in all the samples. Pyrite abundance varies from approximately 3% in sample 25 to 10% in sample 23. Chalcopyrite abundance is below 1% in samples 25 and 26 and close to 2% in samples 22, 23 and 24.

Pyrite occurs as anhedral to subhedral grains, 5 µm to 2 mm in size, in lithic clasts or less commonly as subangular liberated grains, 5 to 600 µm in size (samples 22, 23 and 24 only). Chalcopyrite variably occurs as anhedral grains, 5 to 600 µm in size, in lithic clasts in samples 22, 23, 24 and 25, as inclusion or fracture infill in pyrite (samples 23 and 24) or as chalcopyrite disease (in sphalerite in sample 26). In sample 22, chalcopyrite is additionally disseminated in carbonate veins.

Trace amounts of enargite, molybdenite, galena and sphalerite are observed in some samples. Enargite occurs as inclusions in pyrite in sample 24 and molybdenite forms one elongated mass in a lithic clast in sample 22. In sample 26, masses of sphalerite and of galena occur in the chlorite (+ carbonate) breccia matrix. Sphalerite is pitted by chalcopyrite disease or has cores or attachments of galena.

Grain boundaries of all sulphides are unaltered and no Fe-oxyhydroxides occur in the samples.

4. SUMMARY AND CONCLUSION

The results of petrographic analyses of twenty six samples are presented in this report. The samples were collected in the Kerr, Sulphurets, and Mitchell deposits defining the KSM project. The purpose of the study was to characterize the mineralogy of the samples with particular emphasis on the carbonates and sulphides present. The main conclusions are summarized below.

- The sample suite is mostly made up of a range of different felsic rocks including sericite ± chlorite ± quartz schists, (brecciated) feldspar porphyries and undetermined granular to patchy felsic rocks.
- All samples are dominated by various amounts of quartz, feldspars and sericite. Biotite and chlorite are variably present throughout the sample suite and rutile, titanite and apatite are disseminated in most samples.
- Carbonate is present in most samples and occurs in amounts varying from trace to 20%. It is dominantly colourless (calcite) although possible dolomite/ankerite is also recognized in a few samples. Malachite is additionally observed in sample 14.
- Carbonate is fine- to medium-grained, anhedral and variably occurs as liberated grains and aggregates (vein material), in veins in lithic clasts and as dissemination in lithic clasts.
- In all samples, sulphides are dominated by pyrite and lesser chalcopyrite.
- The two sulphides variably occur as fine to medium-grained liberated grains and grains set in lithic or vein clasts. Chalcopyrite commonly also forms inclusions in pyrite.

- Minor amounts of enargite, bornite, possible chalcocite, galena, tetrahedrite-tennantite, digenite, covellite and sphalerite are observed in some samples.
- Most sulphides occur as inclusions in pyrite or sporadically as inclusions in chalcopyrite. When present, molybdenite forms elongated masses in lithic clast. Chalcocite occurs in sample 19 as liberated masses and masses associated with chalcopyrite in vein clasts. It also occurs as inclusions and overgrowths in and around chalcopyrite. Digenite and covellite sporadically forms partial rims and fracture infills in and around chalcopyrite/chalcocite. In sample 7, 14 and 26, grains and masses of sphalerite occur in lithic clasts. In sample 26, masses of galena also occur in lithic clasts.
- Grain boundaries of all sulphides are typically unaltered. However, in samples 2, 7, 14, 18 and 19, oxidation rims are variably developed around sulphides. These rims can be of hematite and/or Fe-oxyhydroxides around pyrite (samples 2, 7, 14 and 18) or around chalcopyrite (samples 7 and 14) of covellite ± digenite ± Fe-oxyhydroxides around chalcopyrite or chalcocite (samples 2, 7, 14 and 19) or of covellite around sphalerite (sample 7). In sample 14, Fe-oxyhydroxides also occur as thin coating around lithic clasts.

APPENDIX A: SAMPLE DESCRIPTIONS

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
1 (M-09-096 195.5-196.5)	Quartz-sericite-schist	Lithic clasts of microcrystalline granular to foliated masses of sericite and variably internally deformed and recrystallized quartz grains with disseminated rutile grains; disseminated quartz mineral and illite grains/sheaves fragments	50% quartz; 35% illite; 10% pyrite, 1% rutile; 1% chalcopyrite; tr bornite; tr sphalerite	Liberated (5 µm - 1 mm in size) and disseminated (5-600 µm) in lithic clasts	Liberated (5-800 µm) and in clasts (5-500 µm); also as inclusions (<50 µm in size) and as fracture infill in pyrite	Common inclusions of bornite, enargite, sphalerite and tetrahedrite-tennantite in pyrite, all <0.05 mm in size; Disseminated tetrahedrite-tennantite in lithic clasts	Unaltered
2 (M-09-097 52.5-53.5)	Feldspar-amphibole porphyry	Microcrystalline to fine-grained lithic clasts, patchy (possibly clastic?) to porphyritic; Groundmass and phenocrysts variably made up of quartz + feldspars, sericite, chlorite + biotite; Amphibole suggested by diamond-shaped chlorite+ biotite pseudomorphs; disseminated apatite throughout; Lithic clasts and grain boundaries variably oxidized	55% quartz + feldspars; 15% biotite; 10% pyrite; 5% sericite; 5% chlorite; 3% chalcopyrite; 1% hematite, 1% apatite; 1% Fe-oxyhydroxides; tr rutile; tr enargite; tr digenite; tr covellite	Angular liberated (5-300 µm in size) grains and subhedral disseminated (5-800 µm) grains in clasts	Anhedral grains, liberated (5-300 µm) and in lithic clasts (5-100 µm); also as inclusions (<50 µm in size) in pyrite	Variably developed rims of Fe-oxyhydroxides around lithic clasts; rare inclusions of enargite in pyrite	Variably developed rims of hematite and Fe-oxyhydroxides around pyrite and of digenite/covellite around chalcopyrite; oxidation affects liberated grains and grains in lithic clasts
3 (M-09-097 92.5-93.5)	Feldspar porphyry + carbonate (± pyrite ± chalcopyrite) veins	1) Very fine-grained granular to porphyritic quartz-plagioclase-K-feldspar clasts with patches of chlorite (possible phenocrysts) and variably altered by sericite and carbonate; contain disseminated titanite, rutile and apatite and locally fine- to medium-grained anhedral quartz aggregates (quartz vein) ; 2) fine- to medium-grained granular carbonate-pyrite vein clasts	25% carbonate; 20% K-feldspar; 20% (quartz + plagioclase); 7% chlorite; 7% sericite; 7% pyrite; 1% apatite; 1% chalcopyrite; tr-1% magnetite; tr-1% titanite; tr-1% rutile; tr hematite	Typically disseminated (5 µm - 1 mm) in clasts, finer-grained in lithic clasts than in vein clasts; anhedral to subhedral; very rarely as liberated grains (5-200 µm in size)	Small anhedral grains (5-200 µm in size) in lithic clasts, locally associated with magnetite or titanite	Very fine-grained disseminated associated magnetite/hematite in lithic clasts	Pyrite grain boundaries commonly ragged and irregular

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
4 (M-09-097 147.5-148.5)	Feldspar porphyry + quartz (± carbonate ± chalcopyrite) veins	1) Very fine-grained granular to porphyritic quartz-plagioclase-K-feldspar clasts with coarse-grained disseminated K-feldspar phenocrysts; weakly altered by sericite and carbonate; contain disseminated chlorite, titanite, rutile and apatite and locally fine- to medium-grained anhedral quartz aggregates (quartz vein) ; 2) Medium-grained granular quartz-pyrite(-carbonate) vein clasts	30% K-feldspar; 30% (quartz + plagioclase); 10% chlorite; 5% sericite; 5% carbonate; 5% pyrite; 3% magnetite; 3% chalcopyrite; 1% apatite; 1% titanite; tr-1% rutile; tr enargite; tr chalcocite; tr sphalerite	Liberated (5 µm - 2.6 mm in size) and disseminated (5 µm - 1.2 mm) in clasts; typically anhedral	Small anhedral grains (5-300 µm in size) in lithic clasts or liberated (5-100 µm in size); also as inclusions and fracture infill in pyrite	Very fine-grained inclusions of enargite, chalcocite and sphalerite in pyrite; inclusions <50 µm in size	Unaltered
5 (M-09-106 58.5-59.5)	Sericite-quartz schist + quartz-carbonate-chlorite-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite and variably internally deformed and recrystallized quartz grains with disseminated rutile grains; lithic clasts of granular quartz and carbonate (+ chlorite + pyrite); disseminated quartz mineral and sericite, chlorite grains/sheaves fragments	40% quartz; 20% sericite; 15% carbonate; 10% chlorite; 12% pyrite, 1% chalcopyrite, 1% apatite; tr rutile, tr molybdenite, tr tetrahedrite-tennantite, tr bornite; tr sphalerite	Liberated (5 µm - 12mm in size) and disseminated (5 µm - 1.4 mm) in clasts	Liberated (5-100 µm) and in clasts (5-200 µm); also as inclusions (<100 µm in size) and as fracture infill in pyrite	Sporadic inclusions of bornite, sphalerite and tetrahedrite-tennantite in pyrite, all <0.1 mm in size; Tetrahedrite-tennantite in fractures in pyrite with chalcopyrite; Sheaves of molybdenite (0.1 -0.3 mm), liberated and in clasts	Unaltered
6 (M-09-106 34.5-35.5)	Chlorite-sericite-quartz schist + quartz-carbonate-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite, foliated chlorite and variably internally deformed and recrystallized quartz grains with disseminated rutile grains; Lithic clasts of granular quartz and interstitial carbonate (± pyrite); disseminated quartz and carbonate mineral fragments and of sericite, chlorite grains/sheaves fragments	40% quartz; 5% carbonate; 30% sericite; 15% chlorite; 8% pyrite, 1% chalcopyrite, tr rutile; tr sphalerite	Liberated (5 µm - 0.5mm in size) and disseminated (5 µm - 1 mm) in clasts	Liberated (5-100 µm) and in clasts (5-200 µm); also as inclusions (<60 µm in size), overgrowths and fracture infill in pyrite	Rare inclusions of sphalerite in pyrite	Unaltered
7 (M-09-108 56.5-57.5)	Feldspar porphyry + carbonate-quartz veins	Altered porphyritic clasts made up of fine-grained quartz (+ feldspar) groundmass with disseminated apatite, chlorite, carbonate; phenocrysts of K-feldspars and plagioclase locally preserved from sericite + chlorite alteration; patches of chlorite + sulphides throughout (former phenocrysts?); coarser-grained carbonate in thin veinlets in clasts and as monomineralic vein fragments; local Fe-oxyhydroxide rims and stain in clasts	55% quartz + feldspars; 12% carbonate; 10% chlorite; 10% sericite; 7% pyrite, 2% chalcopyrite, 1% apatite; tr rutile; tr sphalerite; tr covellite; tr hematite; tr Fe-oxyhydroxides	Anhedral grains, variably poikilitic, disseminated (5 µm - 1.4 mm in size) in lithic clasts	Anhedral grains (5-100 µm) disseminated in clasts	Anhedral grains and masses of sphalerite (5 µm - 1 mm) in lithic clasts	Sporadic covellite rims around sphalerite or chalcopyrite; local rims of hematite around pyrite or chalcopyrite

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
8 (M-09-108 118.5-119.5)	Feldspar porphyry	Fine- to medium-grained plagioclase and K-feldspar phenocrysts in a very fine-grained groundmass of feldspars + quartz, variably altered by sericite and carbonate; possible mafic phenocrysts pseudomorphed by rutile + sericite; most altered clasts similar to sericite schists; cut by variably thick fine-grained carbonate (+ quartz) veinlets	45% quartz + feldspars; 25% sericite; 15% pyrite; 10% carbonate; 2% chlorite; tr chalcopyrite; tr rutile; tr enargite; tr apatite	Anhedral grains, typically disseminated (5-800 µm) in clasts or rarely liberated (5-800 µm in size)	Rare small anhedral grains in clasts (5-50 µm); also as inclusions (<50 µm in size) and as fracture infill in pyrite	Rare inclusions of enargite (<50 µm) in pyrite	Unaltered
9 (M-09-108 162.5-163.5)	Sericite schist	Patchy fine- to very fine-grained clasts of granular quartz (and possibly feldspars), carbonate, foliated sericite and chlorite; local attachments of coarser-grained quartz or carbonate suggesting vein material; Liberated quartz, feldspars and carbonate mineral fragments and sericite, chlorite sheaves	40% quartz + feldspars; 30% sericite; 10% chlorite; 7% pyrite; 7% carbonate; 1% chalcopyrite; tr rutile; tr enargite; tr apatite; tr hematite; tr sphalerite	Anhedral grains, disseminated (5 µm- 1mm) in clasts or liberated (5-400 µm in size)	Anhedral grains (5-80 µm) in clasts; also as inclusions (<50 µm in size), overgrowths, attachments and as fracture infill in pyrite	Inclusions of enargite, sphalerite and hematite in pyrite; all inclusions <50 µm	Unaltered
10 (M-09-108 184.5-185.5)	Sericite schist + quartz-carbonate-pyrite veins	Lithic clasts of microcrystalline granular to fine-grained foliated masses of sericite, foliated chlorite and disseminated quartz, carbonate, rutile, opaque (Fe, Ti)-oxides and apatite; Lithic clasts of granular quartz and carbonate (+ pyrite); disseminated quartz and carbonate mineral fragments and of sericite, chlorite grains/sheaves fragments.	70% sericite; 15% quartz; 10% chlorite; 5% carbonate, 15% pyrite, 1% chalcopyrite, tr rutile, tr (Fe, Ti)-oxides; tr apatite; tr molybdenite; tr tetrahedrite-tennantite; tr sphalerite	Liberated (5-750 µm in size) and disseminated (5-200 µm) in lithic clasts	Liberated (5-100 µm) and in clasts (5-80 µm); also as inclusions (<50 µm in size) and as fracture infill in pyrite and as pyrite overgrowths	Rare inclusions of sphalerite and tetrahedrite-tennantite in pyrite; molybdenite (10-200) occurring liberated or as attachments to pyrite	Unaltered
11 (M-09-102 120.5-121.5)	Feldspar porphyry	Patchy to vaguely porphyritic fine- to very fine-grained clasts of granular quartz, feldspars, carbonate, foliated sericite and chlorite; local thin carbonate veins throughout clasts	40% feldspars; 20% quartz; 15% sericite; 15% carbonate; 5% pyrite; 1% chlorite; 1% rutile; 1% apatite; tr chalcopyrite, tr enargite; tr tetrahedrite-tennantite; tr sphalerite	Disseminated subhedral grains (5-600 µm) in lithic clasts; less commonly as anhedral masses in clasts	Anhedral grains (5-100 µm) in clasts; also as inclusions, attachments and fracture infill in pyrite	Rare inclusions of rutile, sphalerite and tetrahedrite-tennantite in pyrite; all inclusions < 50 µm in size	Unaltered

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
12 (M-09-102A 125.5-126.5)	Feldspar porphyry	Granular to porphyritic very fine-grained clasts of granular quartz, feldspars, carbonate and foliated sericite	35% feldspars; 20% quartz; 15% sericite; 15% carbonate; 12% pyrite; 1% rutile; tr apatite; tr chalcopyrite, tr tetrahedrite-tennantite, tr zircon; tr sphalerite	Disseminated anhedral to subhedral grains (5-800 µm) in lithic clasts; very rare inclusions (< 30 µm in size) in chalcopyrite	Anhedral grains (5-200 µm) in clasts; rarely as inclusions (< 30 µm) in pyrite	Few inclusions of sphalerite and tennantite in chalcopyrite; none in pyrite	Unaltered
13 (M-09-102A 133.5-134.5)	Undetermined	Granular very fine-grained to microcrystalline clasts, locally containing ill-defined phenocrysts; Clast groundmass made up of granular quartz and feldspars with disseminated carbonate and sericite; Cut by variably thick carbonate veinlets	60% (quartz + feldspars); 20% carbonate; 10% sericite; 5% pyrite; 1% rutile; 1% apatite; tr-1% chalcopyrite; tr sphalerite	Disseminated anhedral to subhedral grains (5-400 µm) in lithic clasts	Anhedral grains (5-25 µm) in clasts; rarely as inclusions (< 25 µm) or attachments to pyrite; disseminated, extremely fine-grained (<30 µm) in a carbonate vein in a clast	Few inclusions of sphalerite in pyrite	Unaltered
14 (M-09-110 34.5-35.5)	Undetermined	Granular very fine-grained to microcrystalline clasts; Clast groundmass made up of granular quartz and feldspars with disseminated carbonate, sericite, chlorite, rutile, apatite, titanite and sulphides; Possible quartz and feldspar phenocrysts present but extensively internally deformed or recrystallized; Fine-grained biotite/sericite dissemination in some lithic clasts; Lithic clasts locally cut by thin carbonate veinlets and with patches of malachite; Lithic clasts variably stained and rimmed by Fe-oxyhydroxides	60% (quartz + feldspars); 15% biotite; 5% carbonate; 5% sericite; 5% chlorite;1-2% hematite; 1-2% pyrite; 1% rutile; 1% chalcopyrite; 1% apatite; 1% Fe-oxyhydroxides; 1% titanite; tr magnetite; tr covellite;	Disseminated anhedral to euhedral grains (5-300 µm) in lithic clasts	Anhedral grains (5-200 µm) in lithic clasts and rare inclusions in pyrite	Anhedral grains of sphalerite (5-300 µm in size) and anhedral to subhedral grains of hematite (5-100 µm) disseminated in clasts; few granular clusters of magnetite	Rims of Fe-oxyhydroxides developed around lithic clasts and around sulphides / hematite and associated with covellite; disseminated hematite

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
15 (M-09-110 88.5-89.5)	Undetermined + carbonate veins + quartz veins	Granular very fine-grained clasts with locally preserved extensively internally deformed feldspar and quartz phenocrysts, locally possible clastic texture; Clast groundmass made up of granular quartz and feldspars with disseminated carbonate, biotite, sericite, chlorite, rutile, apatite and sulphides; Lithic clasts locally cut by thin carbonate veinlets; rare coarse-grained quartz or carbonate grain fragments suggest quartz or carbonate vein fragments	50% (quartz + feldspars); 20% biotite; 7% carbonate; 5% sericite; 5% chlorite; 5% pyrite; 2% rutile; 2% chalcopyrite; 2% apatite; tr enargite	Anhedral to subhedral grains (5-300 µm in size) in lithic clasts	Anhedral grains (5-200 µm in size) in lithic clasts; rare inclusions (<50 µm in size) in pyrite; local corona around pyrite	Inclusions (<25 µm in size) of possible enargite in pyrite	Unaltered
16 (M-09-110 342.5-343.5)	Sericite-quartz schist + quartz-carbonate-chlorite-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite (+ chlorite) and variably internally deformed quartz; Disseminated rutile in lithic clasts; Disseminated quartz and carbonate mineral fragments and sericite and chlorite sheaves.	25% sericite; 35% quartz; 5% chlorite; 30% pyrite, 1% chalcopyrite, tr rutile; tr molybdenite; tr tetrahedrite-tennantite	Mostly liberated (5 µm - 2 mm in size) and less commonly disseminated (5-600 µm) in lithic clasts	Rare irregularly shaped inclusions (<100 µm in size) in pyrite	-	Unaltered
17 (M-09-112 224.5-225.5)	Anhydrite-quartz-sericite schist + quartz-carbonate-chlorite-pyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite with disseminated grains and patches of quartz, feldspars and anhydrite; disseminated clusters of rutile; coarser-grained quartz and carbonate in veins in clasts and as liberated vein fragments; liberated quartz, feldspars, chlorite and sericite	40% sericite; 35% (feldspars + quartz); 7% pyrite, 7% anhydrite; 3% carbonate; 1% chalcopyrite, 1% rutile; 1% apatite; tr bornite; tr chalcocite; tr sphalerite	Disseminated anhedral grains (5 µm - 1 mm) in lithic clasts	Anhedral grains (5-100 µm) in clasts; also as inclusions (<75 µm in size) and overgrowths in pyrite	Inclusions (<75 µm in size) of bornite, sphalerite and chalcocite in pyrite	Unaltered
18 (K-09-01 84.5-85.5)	Sericite schist + quartz-carbonate-chlorite-pyrite-chalcopyrite veins	Lithic clasts of microcrystalline granular to foliated masses of sericite/chlorite with disseminated grains and patches of quartz and feldspars, clusters of rutile and grains of apatite; coarser-grained quartz and carbonate in veins in clasts and as liberated vein fragments; liberated quartz, feldspars, chlorite and sericite	45% sericite; 15% (feldspars + quartz); 15% chlorite; 10% pyrite, 5% carbonate; 2% chalcopyrite, 2% rutile; 2% Fe-oxyhydroxides; 2% apatite; tr enargite; tr chalcocite, tr bornite	Anhedral to subhedral grains, liberated (5-600 µm in size) and disseminated (5 µm - 1 mm) in lithic clasts	Anhedral grains and masses (5-200 µm) in clasts or liberated (5-500 µm). Also as inclusions (<50 µm in size) in pyrite	Rounded inclusions of enargite, bornite (<200 µm) in pyrite and elongated inclusions (< 75 µm long) of possible chalcocite; Anhedral masses of Fe-oxyhydroxides, typically liberated, rarely in schist clasts	Anhedral masses of Fe-oxyhydroxides, liberated or occurring in schist clasts and preserving bits of pyrite

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
19 (K-09-02 66.5-67.5)	Sericite-quartz schist	Extremely thin section; Lithic clasts of microcrystalline granular to foliated masses of sericite and variably internally deformed quartz; Disseminated rutile in lithic clasts; Disseminated quartz mineral fragments and sericite sheaves.	35% quartz; 25% sericite; 30% pyrite; 3% chalcocite; 2% chalcopyrite; 2% apatite; 1% rutile; tr covellite	Liberated (5-900 µm in size) and disseminated (5-400 µm) in lithic clasts	Mostly as overgrowths, fracture infill and inclusions (<100 µm in size) in pyrite; also disseminated (5-400 µm) in clasts or liberated (5-100 µm)	Liberated chalcocite (5-600 µm); groundmass of chalcocite in one lithic clast; Inclusions and overgrowths of chalcocite associated with chalcopyrite in pyrite; covellite as local rims and fracture infill around Cu-sulphides	Local partial to complete rims and fracture infill of covellite around chalcopyrite / chalcocite
20 (K-09-03 140.5-141)	Sericite-quartz schist + quartz-carbonate(-pyrite-chalcopyrite) veins	Lithic clasts of microcrystalline granular to foliated masses of sericite (+ chlorite) and variably internally deformed quartz; Disseminated rutile and apatite in lithic clasts; Fine-grained granular lithic clasts of quartz (+carbonate). Disseminated quartz and carbonate grain fragments and sericite sheaves.	45% quartz; 25% sericite; 20% pyrite; 5% chlorite; 2% carbonate; 2% chalcopyrite; 1% apatite; tr rutile; tr bornite; tr enargite	Liberated (5 µm - 1 mm in size) and disseminated (5 µm-1.2 mm) in lithic clasts	Overgrowths, fracture infill and inclusions (<100 µm in size) in pyrite; Masses liberated (5-200 µm in size) or set (5-400 µm) in lithic clasts	Bornite, enargite and possible rutile inclusions in pyrite; all inclusions < 50 µm in size	Unaltered
21 (K-09-04 126.5-127.5)	Sericite-quartz schist + quartz(-carbonate-pyrite-chalcopyrite) veins	Lithic clasts of variably internally deformed quartz with disseminated masses of microcrystalline granular to foliated sericite (+ chlorite); Disseminated rutile and apatite in lithic clasts; Fine-grained monomineralic lithic quartz clasts. Disseminated quartz mineral fragments and sericite sheaves.	40% quartz; 30% pyrite; 20% sericite; 5% chlorite; 2-3% chalcopyrite; 1% apatite; tr rutile; tr bornite; tr enargite	Liberated (5 µm - 1.6 mm in size) and disseminated (5 µm - 2 mm) in lithic clasts	Overgrowths, fracture infill and inclusions (<100 µm in size) in pyrite; Liberated (5-200 µm in size) and disseminated (5 µm 1 mm) in lithic clasts	Bornite, enargite and possible rutile inclusions in pyrite; all inclusions < 50 µm in size	Unaltered
22 (S-08-06 252.5-253.5)	Feldspar porphyry + quartz ± carbonate veins	Variably altered porphyritic clasts, made up of fine-grained granular quartz and feldspars and coarser-grained feldspar phenocrysts; chlorite, apatite and rutile disseminated in the groundmass; variably altered by sericite and carbonate; Some carbonate(+quartz) veins in clasts	45% (quartz + feldspars); 25% chlorite; 10% sericite; 7% carbonate; 5% pyrite; 2% chalcopyrite; 2% rutile; 1% apatite; tr molybdenite	Disseminated anhedral to subhedral grains (5-600 µm) in lithic clasts; one liberated subhedral grain 0.3 mm in size	Anhedral grains (5-200 µm) in vein clasts	One elongated mass (1 mm long) of molybdenite sheaves in a clast	Unaltered

Sample	Lithology	Gangue minerals	Mineralogy	Pyrite	Chalcopyrite	Other	Sulphide grain boundaries
23 (S-09-11 350.5-351.5)	Sericite schist + quartz ± chlorite ± carbonate veins	Microcrystalline foliated clasts of associated sericite and chlorite with disseminated rutile and quartz (and feldspars) grains; coarser-grained mineral fragments and polygranular lithic fragments of chlorite, carbonate, quartz, suggest possible vein material	40% sericite; 25% (quartz + feldspars); 15% chlorite; 10% pyrite; 5% carbonate; 2% chalcopyrite; 2% rutile; 1% apatite	Anhedral to subhedral grains, occurring disseminated (5 µm- 2mm) in lithic clasts or liberated (5-600 µm)	Anhedral grains (5-200 µm) in lithic clasts; also as inclusions (< 200 µm in size) and fracture infill in pyrite	-	Unaltered
24 (S-09-11 374.5-375.5)	Sericite schist + quartz ± carbonate (± chlorite) veins	Microcrystalline foliated lithic clasts of sericite and lesser chlorite with disseminated patches of chlorite + rutile and of sulphides ± chlorite ± carbonate and disseminated grains of quartz/feldspars; Thin irregular carbonate or chlorite/carbonate veinlets throughout clasts; Coarser-grained mineral fragments and polygranular vein fragments of carbonate ± chlorite, or metamorphic quartz	25% sericite; 20% (quartz + feldspars); 20% chlorite; 20% carbonate; 7% pyrite; 2% chalcopyrite; 2% rutile; tr enargite	Anhedral to subhedral grains, occurring disseminated (5 µm- 1.2mm) in lithic clasts or liberated (5-600 µm)	Anhedral grains (5-600 µm) in lithic clasts; also as inclusions (< 50 µm in size) in pyrite	Inclusions of enargite in pyrite; all inclusions <50 µm	Unaltered
25 (S-09-12 144.5-145.5)	Brecciated porphyritic rock	Lithic clasts of possible feldspar porphyry as well as clasts made up of anhedral granular quartz + feldspars, polycrystalline microcrystalline to fine-grained felsic rock fragments all set in a groundmass of chlorite, rutile and carbonate and suggesting clasts of fragmental rock; all fragments commonly crosscut by very thin carbonate veinlets	50% (quartz + feldspar); 30% chlorite; 15% carbonate; 3% pyrite; 1% rutile; tr chalcopyrite	Anhedral disseminated grains (20-600 µm) in lithic clasts	Anhedral grains (5-200 µm) in lithic clasts	-	Unaltered
26 (S-09-12 172.5-173.5)	Brecciated porphyritic rock	Lithic clasts made up of anhedral K-feldspar fragments, polycrystalline microcrystalline to fine-grained felsic rock fragments all set in a groundmass of chlorite + sulphides + carbonate and suggesting clasts of brecciated rock; all fragments commonly crosscut by very thin carbonate veinlets; quartz and plagioclase abundance low	60% (quartz + feldspar); 15% carbonate; 10% chlorite; 5% pyrite; 2% rutile; 2% sphalerite; tr-1% galena; tr chalcopyrite	Anhedral to subhedral disseminated grains (5-40 µm rarely up to 300 µm) in lithic clasts; also in clusters up to 1.6 mm in size made up of subhedral pyrite and interstitial sphalerite	As chalcopyrite disease in sphalerite	Rare grains of galena (95-100 µm in size) and cores / attachments to chalcopyrite-free sphalerite in lithic clasts; Anhedral sphalerite (5-200 µm) associated with chlorite and pitted by chalcopyrite disease in lithic clasts; Ribbons of sphalerite interstitial to pyrite	Unaltered

APPENDIX B: REPRESENTATIVE PHOTOMICROGRAPHS OF SAMPLES FROM THE MITCHELL DEPOSIT

List of abbreviations used in the description of photomicrographs:

FOV: Field of view – defined for the long dimension of photomicrographs
PPL: Plane polarized light
XPL: Crossed polars
RL: Reflected light

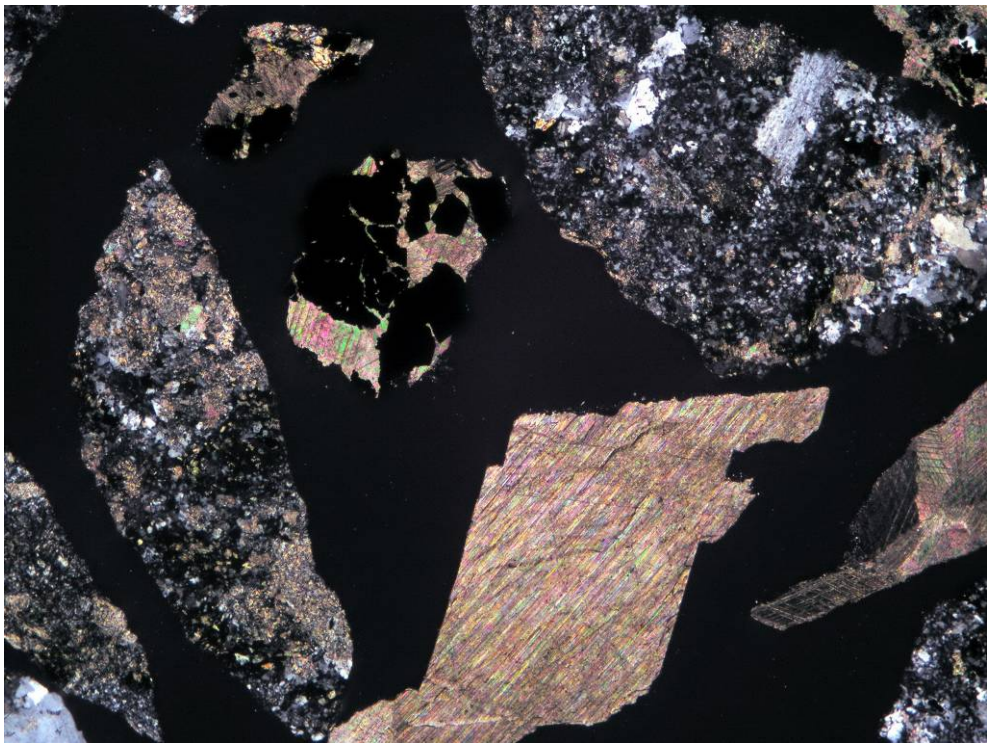

Figure M1: *Photomicrograph of sample 3 showing porphyritic clasts and vein clasts represented by liberated carbonate grains and carbonate-sulphide aggregates. XPL, FOV = ~ 7 mm.*

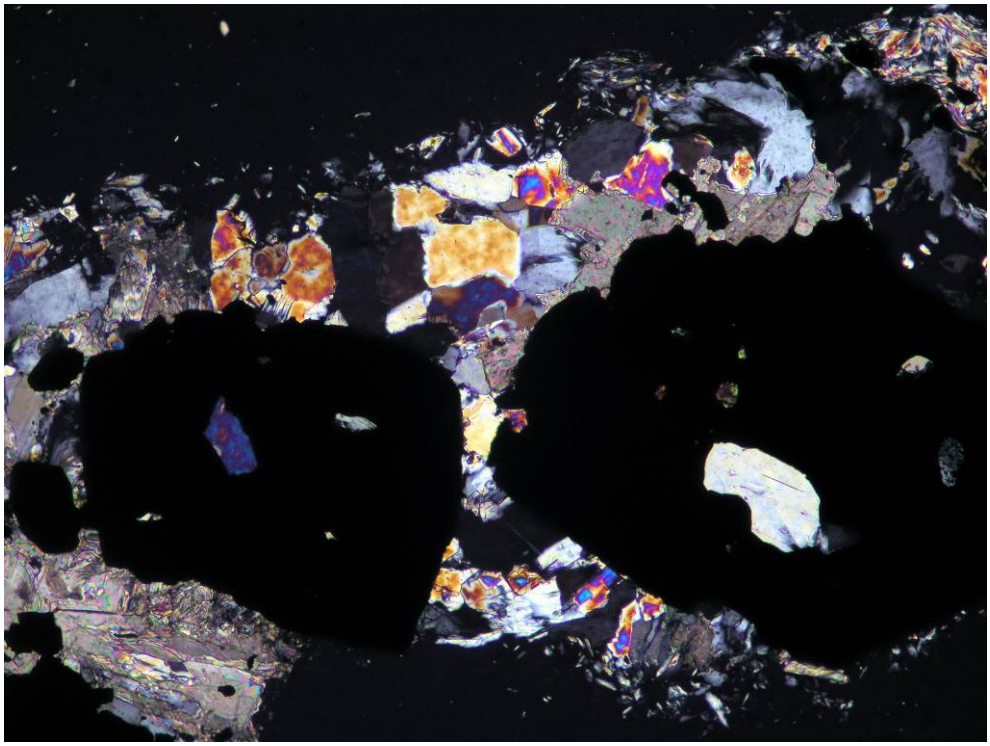

Figure M2: *Photomicrograph of sample 17 showing part of a lithic clasts essentially containing sulphides (black, opaque), carbonate (pinkish birefringence colours) carbonate and anhydrite (bright birefringence colours). XPL, FOV =~ 1.4 mm.*

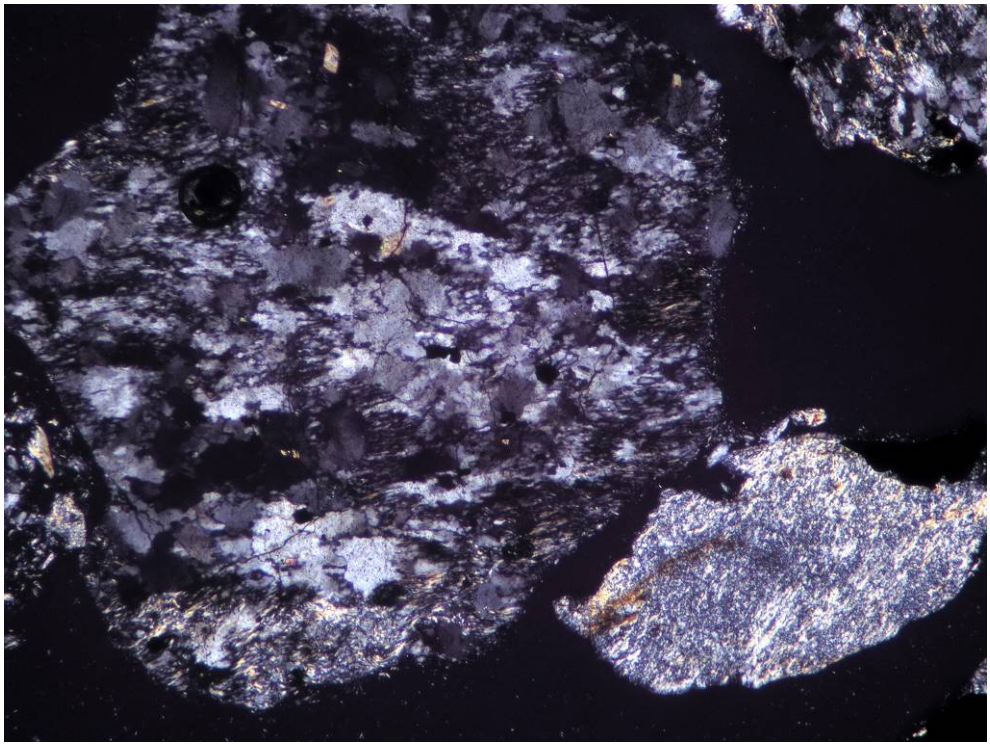

Figure M3: *Photomicrograph of sample 1 showing a quartz clast in which quartz is extremely internally deformed. Subgrains and much finer-grained recrystallized grains occur in the clast. XPL, FOV = ~ 2.7 mm.*

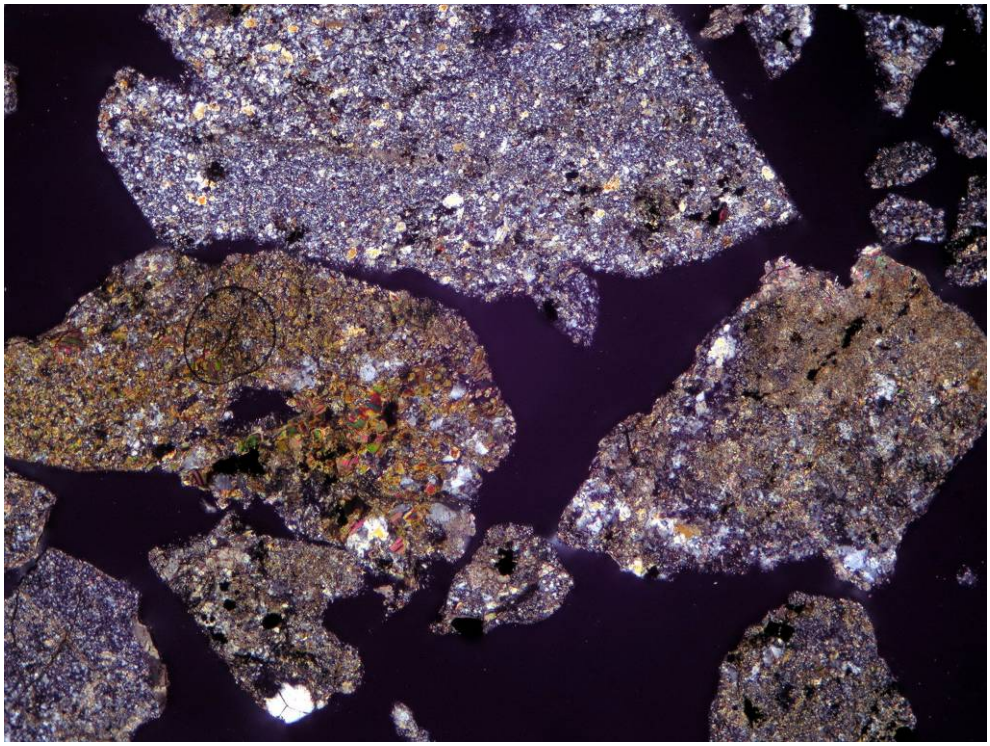

Figure M4: *Photomicrograph of sample 15 showing the occurrence of fine-grained granular clasts. The clast of on the left side of the photomicrograph contains abundant very fine-grained biotite. XPL, FOV = ~ 7 mm.*

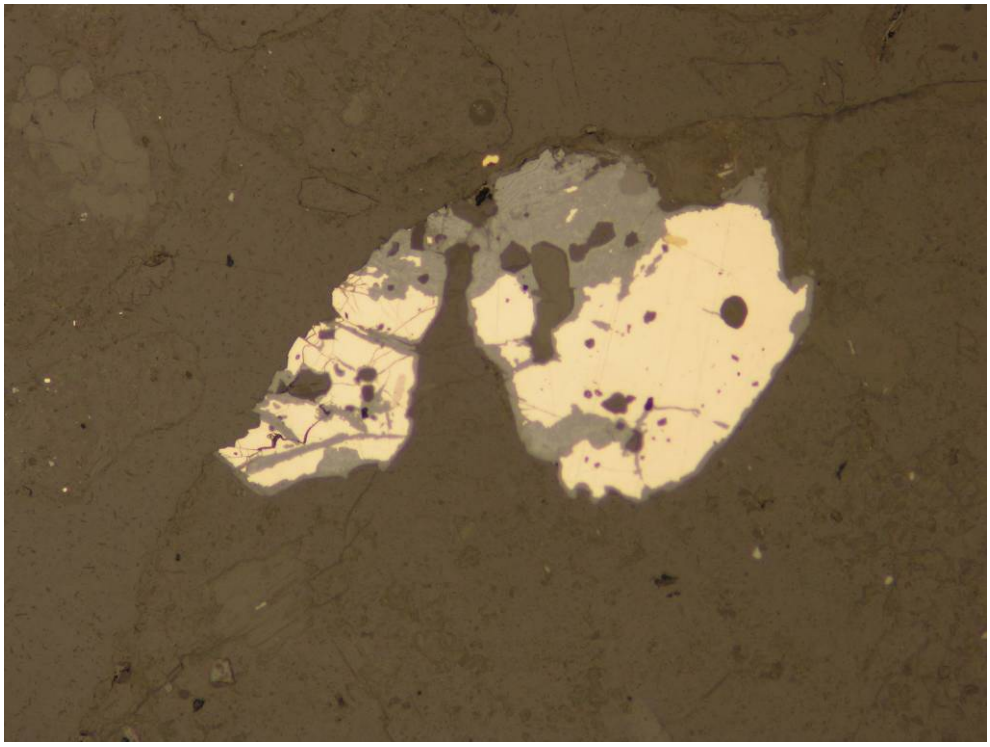

Figure M5: *Photomicrograph of sample 2 showing grains of pyrite (whitish) in a lithic clast. Fractures and grain boundaries are variably coated (and replaced) by hematite and Fe-oxyhydroxides. A yellow inclusion of chalcopyrite also occurs in pyrite (top right). RL, FOV = ~ 1.4 mm*

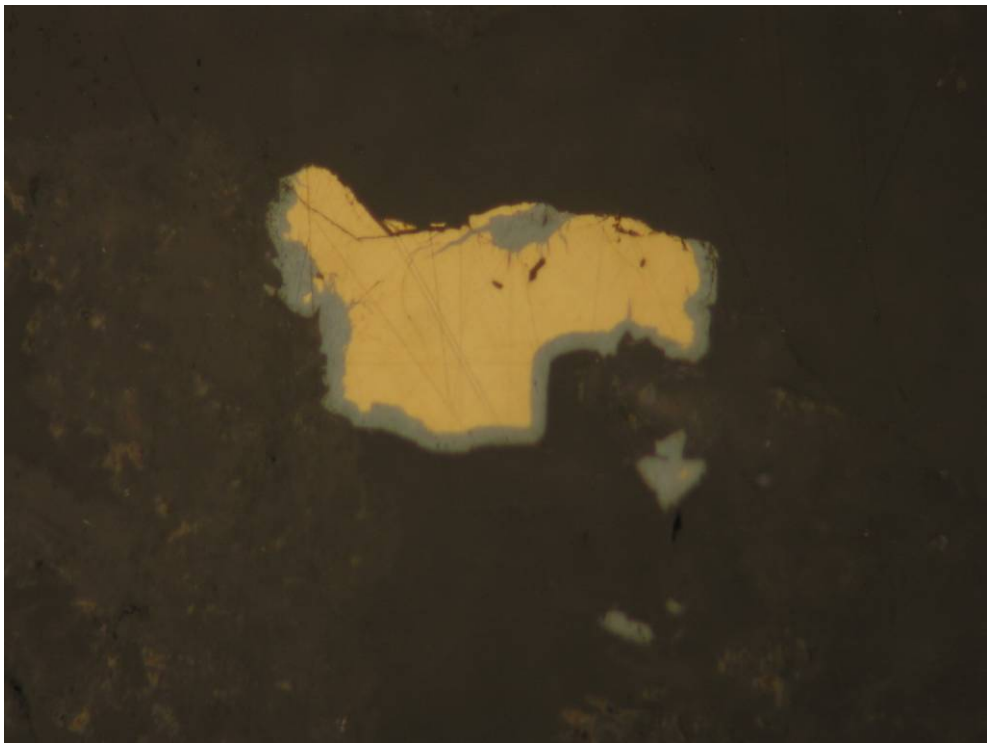

Figure M6: *Photomicrograph of sample 2 showing a grain of chalcopyrite partially rimmed by digenite. RL, FOV = ~ 0.28 mm*

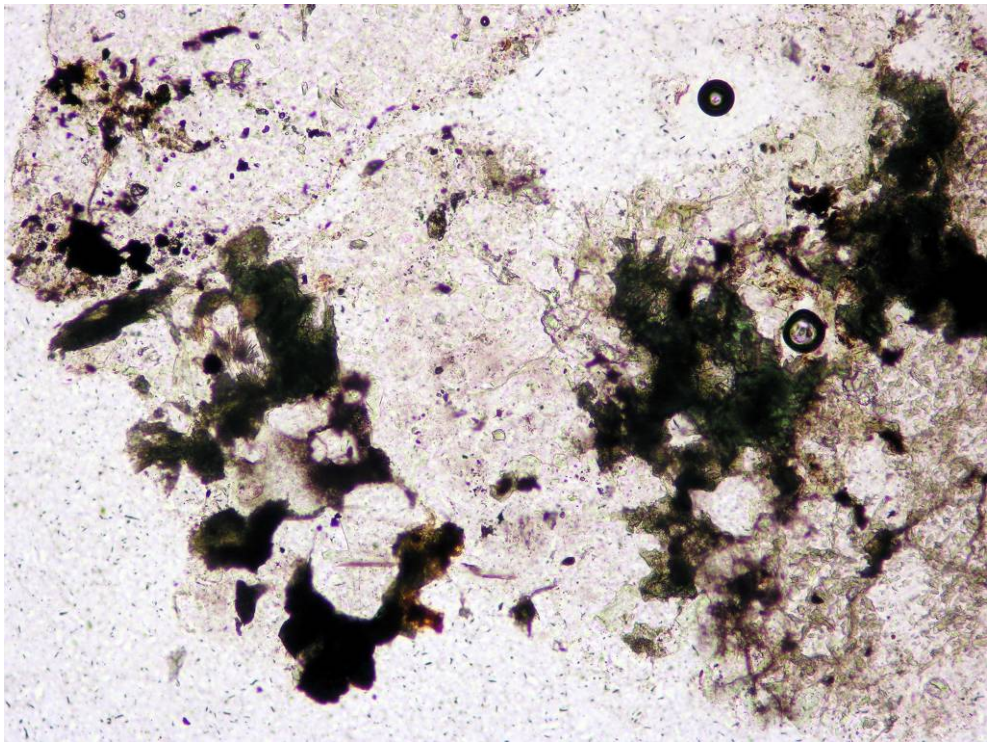

Figure M7: *Photomicrograph of sample 14 showing a lithic clast containing disseminated patches of oxidized sulphides (opaque to brownish) that are associated with green malachite. PPL, FOV = ~ 0.27 mm*

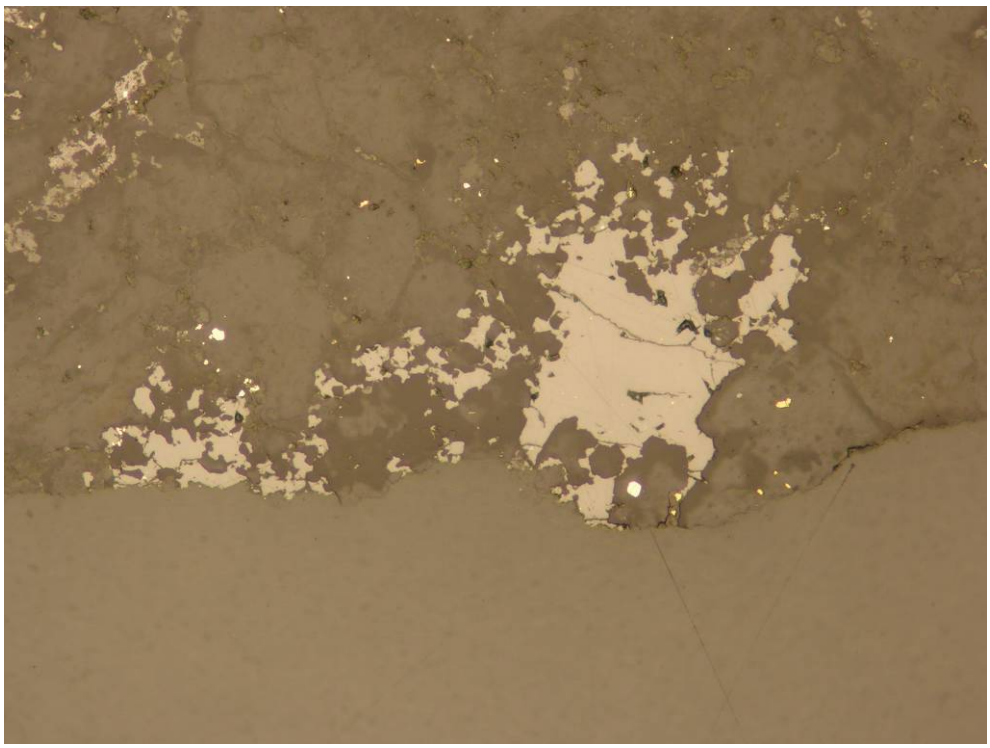

Figure M8: *Photomicrograph of sample 14 showing masses of sphalerite in a lithic clast. RL, FOV = ~ 1.4 mm*

APPENDIX C: REPRESENTATIVE PHOTOMICROGRAPHS OF SAMPLES FROM THE KERR DEPOSIT

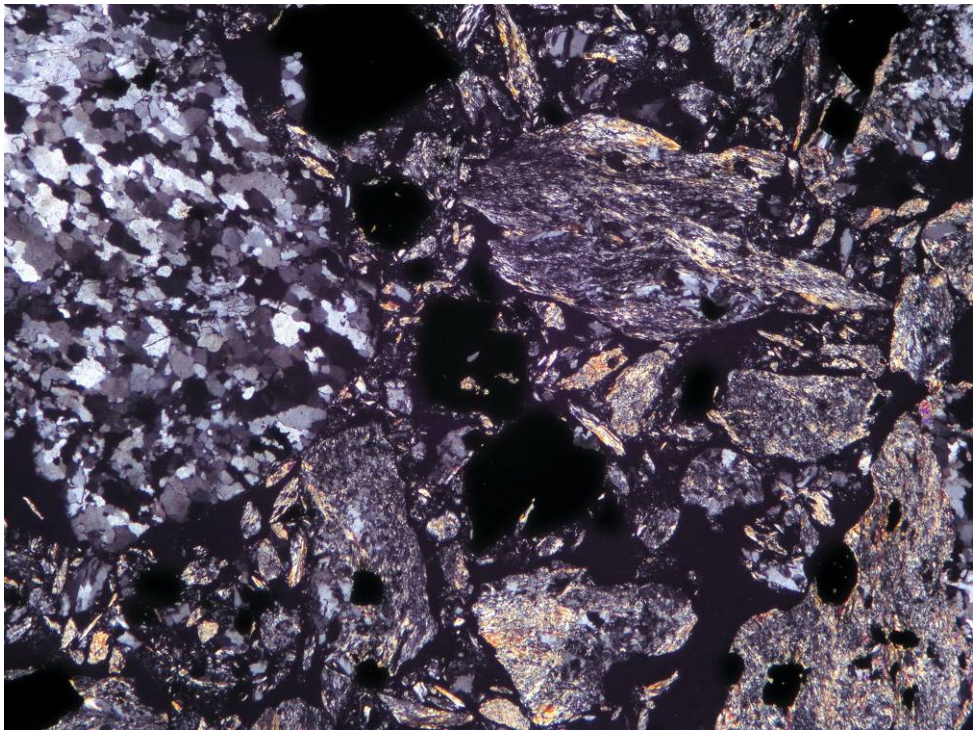

Figure K1: *Photomicrograph of sample 21 showing that most lithic clasts are of foliated sericite-quartz schist. The granular quartz clast on the left side of the photomicrograph is interpreted as vein material. XPL, FOV =~ 7 mm.*

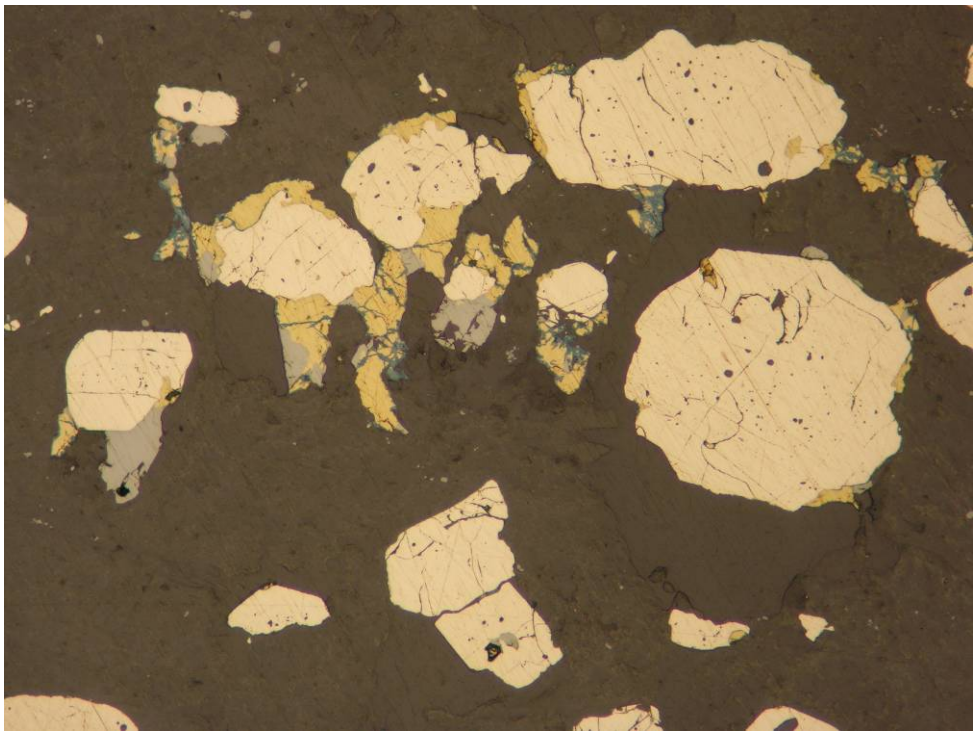

Figure K2: *Photomicrograph of sample 19 showing disseminated small grains of pyrite (off-white) in a lithic clast. The pyrite grains are partially rimmed by yellow chalcopyrite that is associated with grey chalcocite and dark blue covellite. RL, FOV =~ 2.7 mm.*

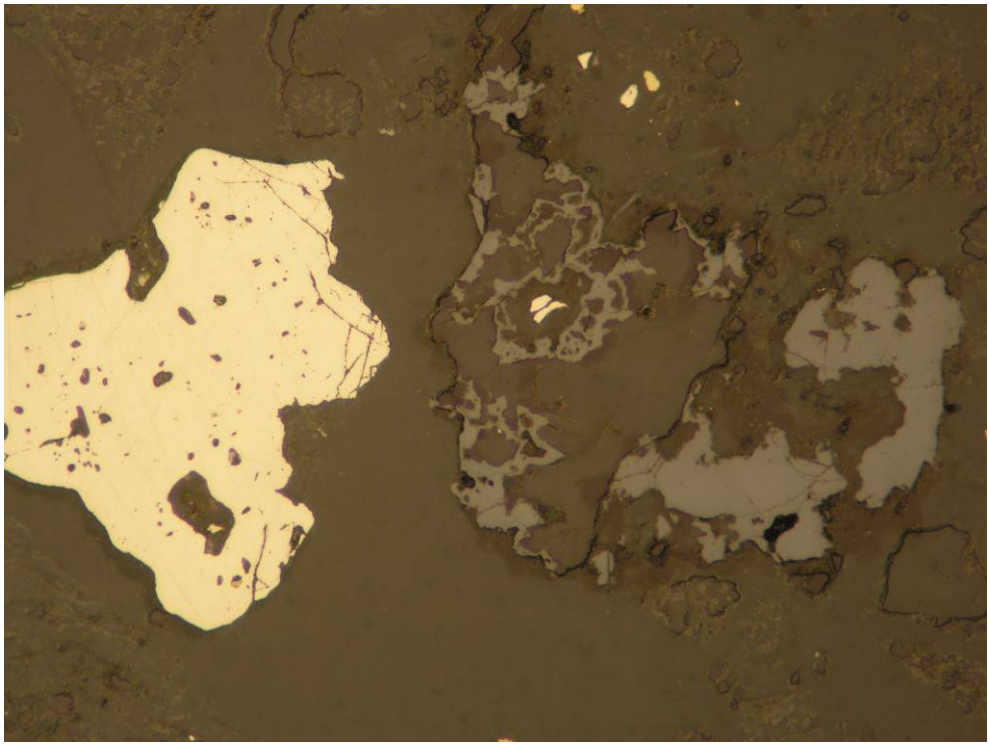

Figure K3: *Photomicrograph of sample 18 showing a liberated mass of pyrite (left) and a lithic clast (right). The payrite is virtually iunaltered while the lithic clast is partially rimmed by Fe-oxyhydroxides. RL, FOV = ~ 0.7 mm.*

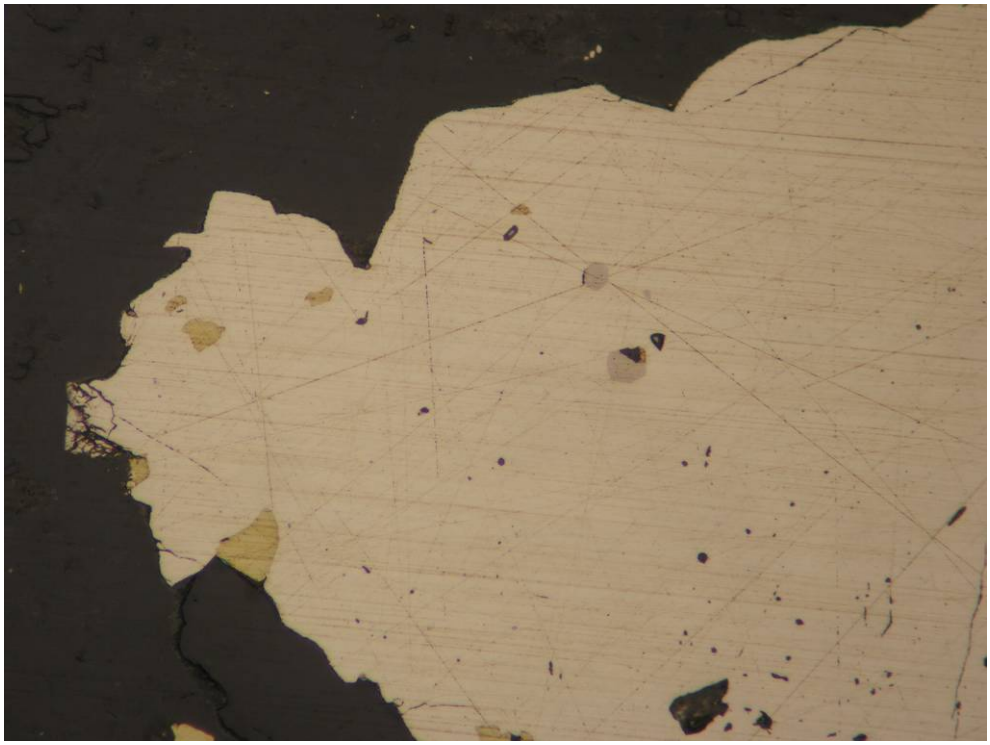

Figure K4: *Photomicrograph of sample 20 showing inclusions of chalcopyrite (yellow) and pinkish inclusions of bornite and enargite in pyrite. RL, FOV = ~ 0.7 mm.*

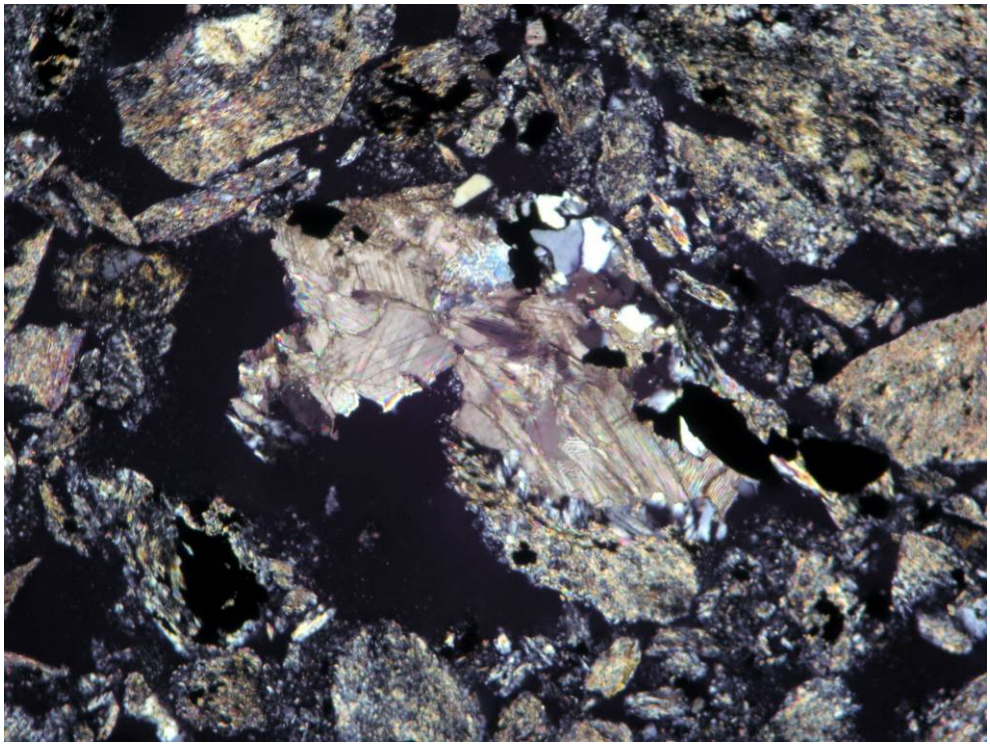

Figure K5: *Photomicrograph of sample 18 showing veins of carbonate (pinkish birefringence colours) and opaque sulphides in a clast of sericite-quartz schist (centre). FOV = ~ 0.27 mm*

APPENDIX D: REPRESENTATIVE PHOTOMICROGRAPHS OF SAMPLES FROM THE SULPHURETS DEPOSIT

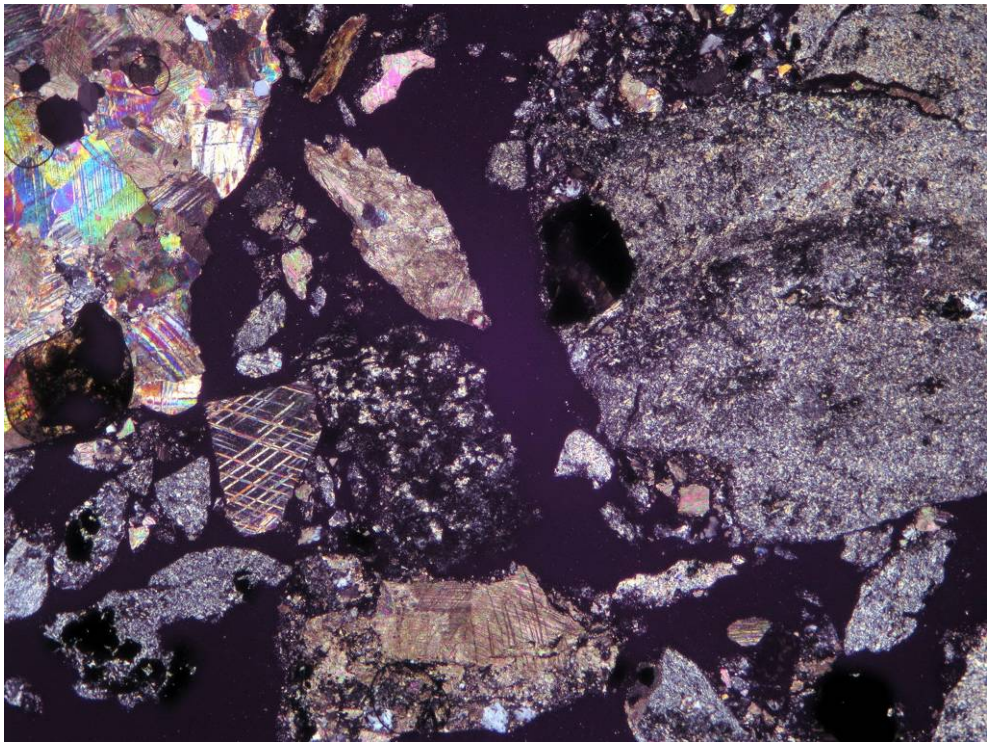

Figure S1: *Photomicrograph of sample 24 showing that the sample is formed by clasts of sericite schist and coarser-grained fragments of carbonate (± quartz) veins. XPL, FOV = ~ 7 mm.*

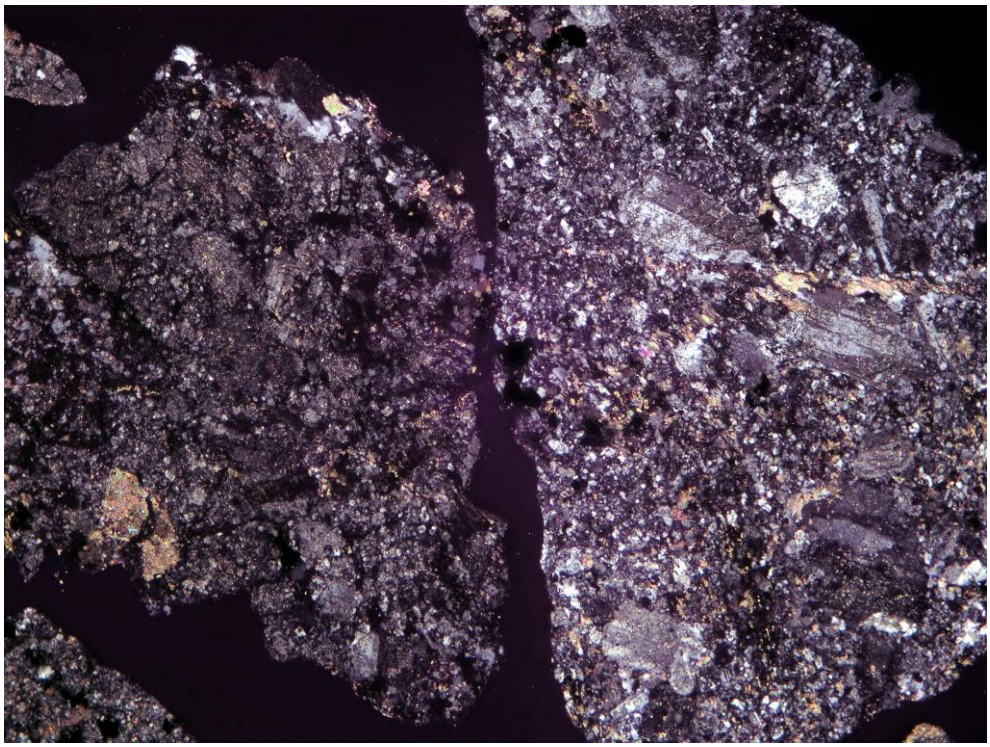

Figure S2: *Photomicrograph of sample 22 showing porphyritic clasts made up of a very fine-grained groundmass of quartz and feldspars containing disseminated feldspar phenocrysts. XPL, FOV =~ 7 mm.*

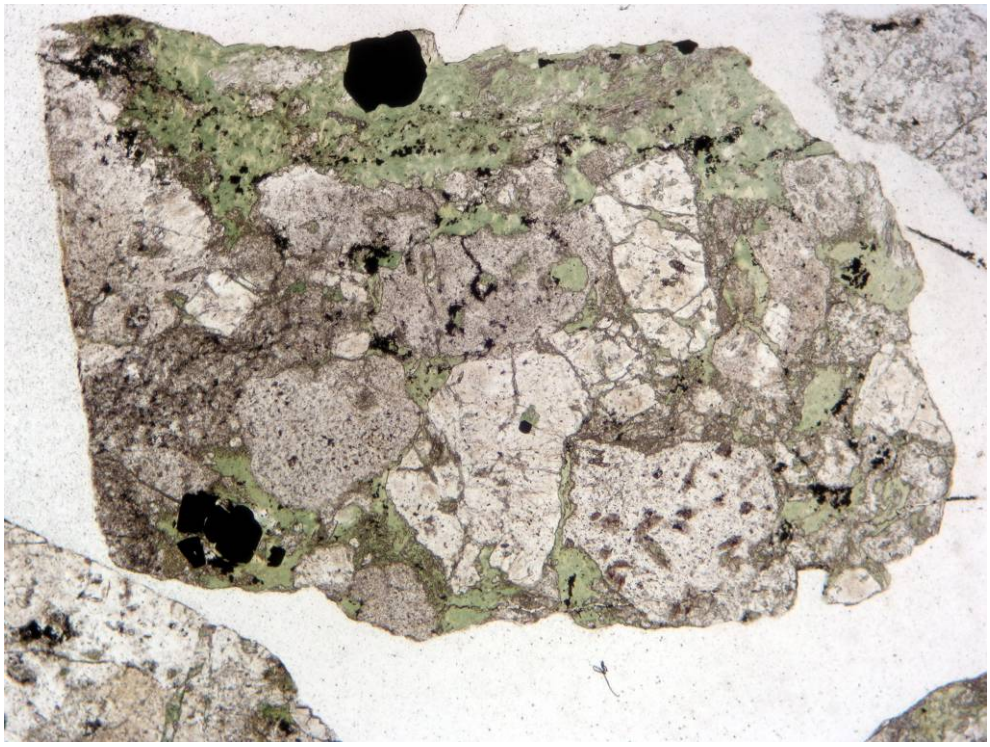

Figure S3: *Photomicrograph of sample 24 showing a brecciated clast. Subangular felsic clasts occur in a groundmass essentially made up of chlorite. PPL, FOV = ~ 7 mm.*

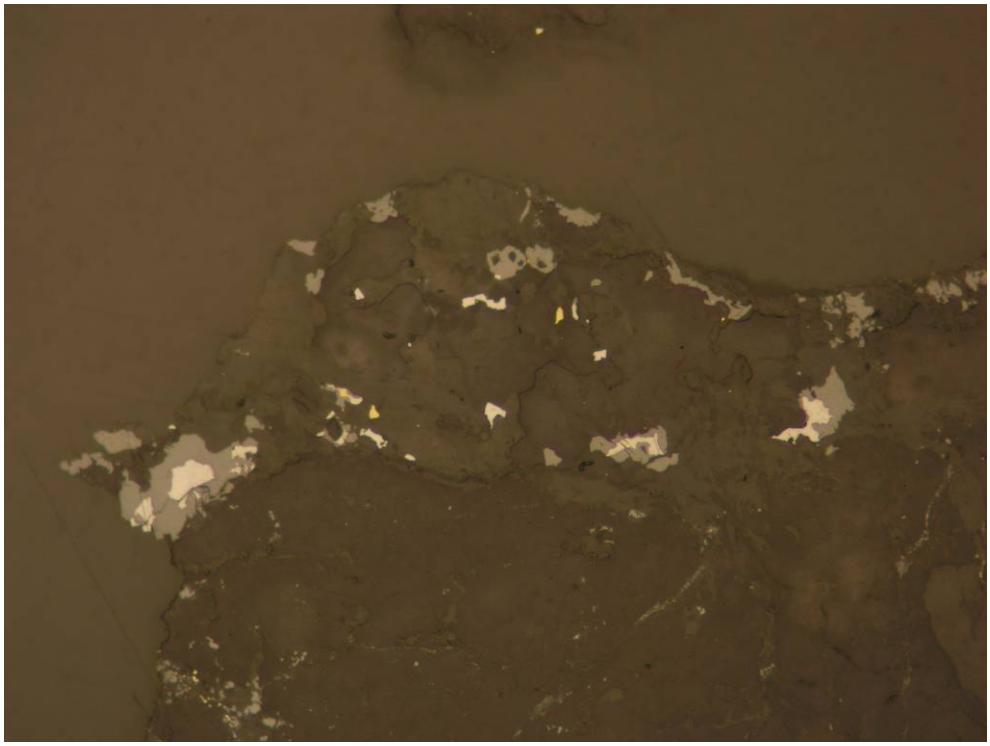

Figure S4: *Photomicrograph of sample 26 showing disseminated masses of off-white galena variably rimmed by masses of chalcopyrite-free sphalerite. RL, FOV = ~ 1.4 mm.*

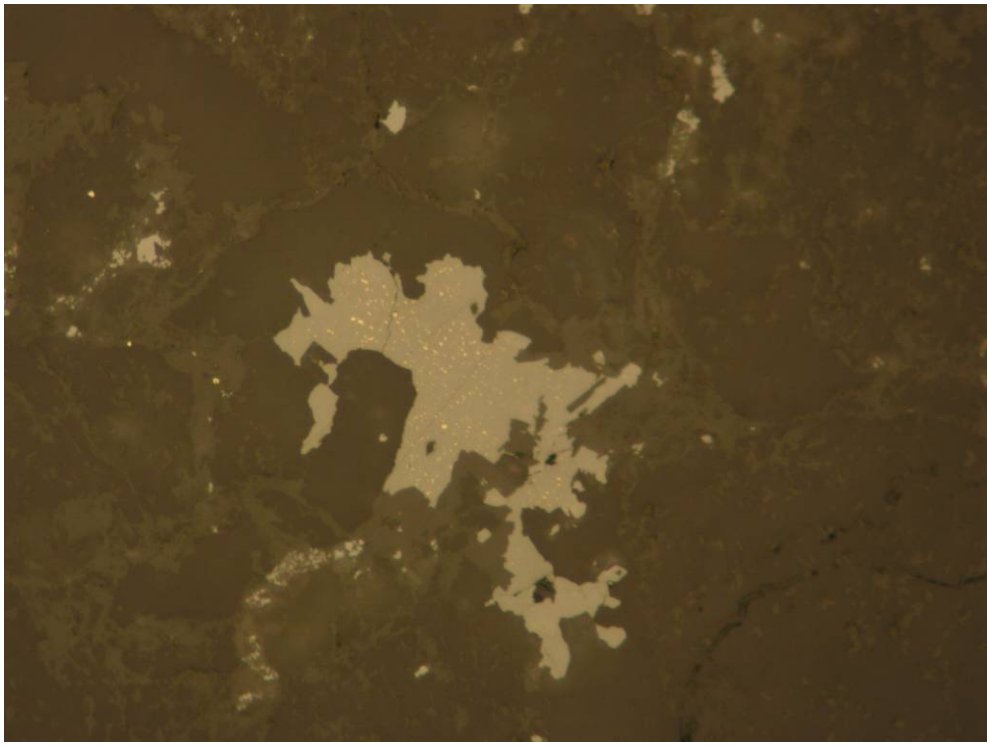

Figure S5: *Photomicrograph of sample 26 showing a mass of sphalerite in a lithic clast. The sphalerite is pitted by chalcopyrite disease. FOV = ~ 0.7 mm*

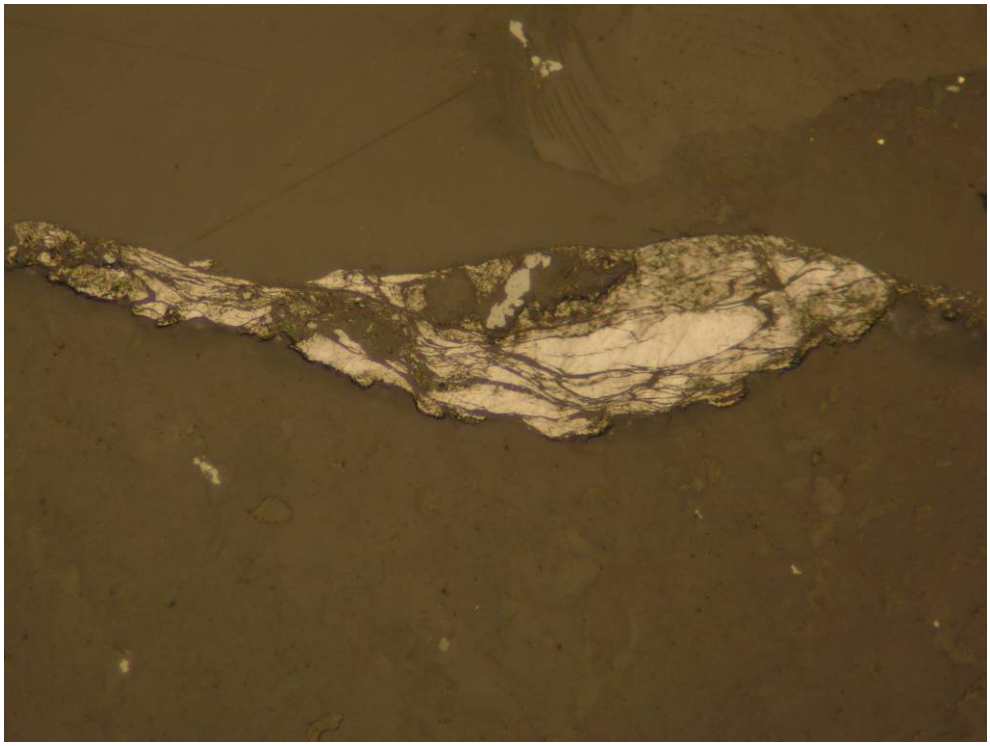

Figure S6: *Photomicrograph of sample 22 showing a mass of molybdenite in a lithic clast. RL, FOV = ~ 0.7 mm*
